

TYPE N

K-GRIP IS AVAILABLE FOR THIS SERIES. SEE PAGES 106-111.

This series of connectors is used primarily with medium sized cables such as RG-8A/U. Because of the excellent electrical and mechanical characteristics of the series, additional connectors for small cables such as RG-55/U and large cables such as RG-17/U have been designed.

The improved type N connectors are weatherproof and incorporate a positive metal-to-metal cable clamping mechanism. They have a peak rating of 1500 volts and are recommended for use up to 10,000 megacycles.

Type N connectors are available in 50 ohm and 70 ohm characteristic impedance types. The latter are designed for use with cables RG-6,-11, and -13/U when impedance matching is critical. They will not mate with the 50 ohm types.

Additional type N connectors are described in the "Captivated Contact Connectors" section.
