

ADVANCE

LOW FREQUENCY SIGNAL GENERATOR TYPE SG81A

THE type SG81A is a wide range l.f. oscillator providing a maximum output of 1 watt into 600 ohms over a frequency range of 15 c/s to 200 kc/s.

The oscillator consists of a 12BH7 and an EF91 used in a capacitive-resistive Wien bridge network. The oscillator is stabilized by a thermistor in the anode circuit, and a second thermistor provides temperature compensation of the oscillatory output voltage. Thus a very constant output level is obtained.

The frequency is varied by means of a ganged variable capacitor and the frequency reading is calibrated on a drum scale of eight inches in length; a logging scale with fitted vernier is used in conjunction with the main scale.

The oscillatory voltage from the Wien bridge oscillator is fed via the SET LEVEL potentiometer to the control grid of a two stage buffer amplifier. The unit attenuator, tapped in one dB steps, is connected between the buffer amplifier and the output stage, and the output level meter, which consists of a moving coil meter and a rectifier bridge network, is connected across the whole of this attenuator. The amplified output of the buffer stage is resistance capacity coupled to the final output amplifier.

The application of negative feedback in the amplifier and output stages, together with stabilization in the oscillator, ensures a constant level with change of frequency. The output voltage is controlled by means of the unit and decade attenuators used together with the SET LEVEL control. The outstanding feature of this instrument is the excellent arrangement of the output terminations and the very convenient mode of attenuator switching. The decade attenuators are balanced pi networks providing full output either balanced or unbalanced, connected to or isolated from earth.

S P E C I F I C A T I O N

S P E C I F I C A T I O N

FREQUENCY RANGE:

15 c/s to 200 kc/s in 4 bands.

FREQUENCY CALIBRATION ACCURACY:

Ranges A, B and C $\pm (1\% + 1 \text{ c/s})$; range D $\pm 2 \%$, with logging scale and vernier.

FREQUENCY STABILITY:

Better than 0.1% at 1 kc/s after warm-up period. With mains voltage variation of $\pm 10 \%$, drift is less than 0.04% at 1 kc/s.

DISTORTION:

Total harmonic and hum content compared with fundamental above 100 c/s:

- (1) better than 40 dB down (1%) with meter set at 1 mW reference level;
- (2) better than 34 dB down (2%) with meter set at +5 dB (maximum output).

There is a slight increase in distortion below 100 c/s and when the output terminals feed into a high impedance on the +20 dB position of the decade attenuator.

HUM LEVEL:

Hum and noise content is less than 0.25% of maximum output.

OUTPUT:

Calibrated in volts and watts, balanced or unbalanced.

VOLTAGE:

20 mV to 25 V r.m.s. into 600 ohms in six ranges indicated by the calibrated meter scales and 10 dB attenuator.

POWER:

0 to 1 watt into 600 ohms, indicated with reference to 1 mW level by 1 dB and 10 dB step attenuators from -35 dB to +25 dB; plus 5 dB above reference level on the meter.

AMPLITUDE ACCURACY:

$\pm 1 \text{ dB}$ over complete frequency range.

OUTPUT IMPEDANCE:

- (1) 600 ohms centre tapped, balanced or unbalanced terminations with respect to earth.
- (2) 300 ohms unbalanced.

There is a rise in output impedance on the $\pm 20 \text{ dB}$ position of the decade attenuator at the high frequency end of the 50-200 kc/s band.

ATTENUATOR ACCURACY (at normal "set" level):

Decade Attenuator: $\pm 1.5 \%$ of attenuator reading.

Units Attenuator: $\pm 1 \%$ of attenuator reading $\pm 0.15 \text{ dB}$ 20 c/s to 200 kc/s.

WEIGHT:

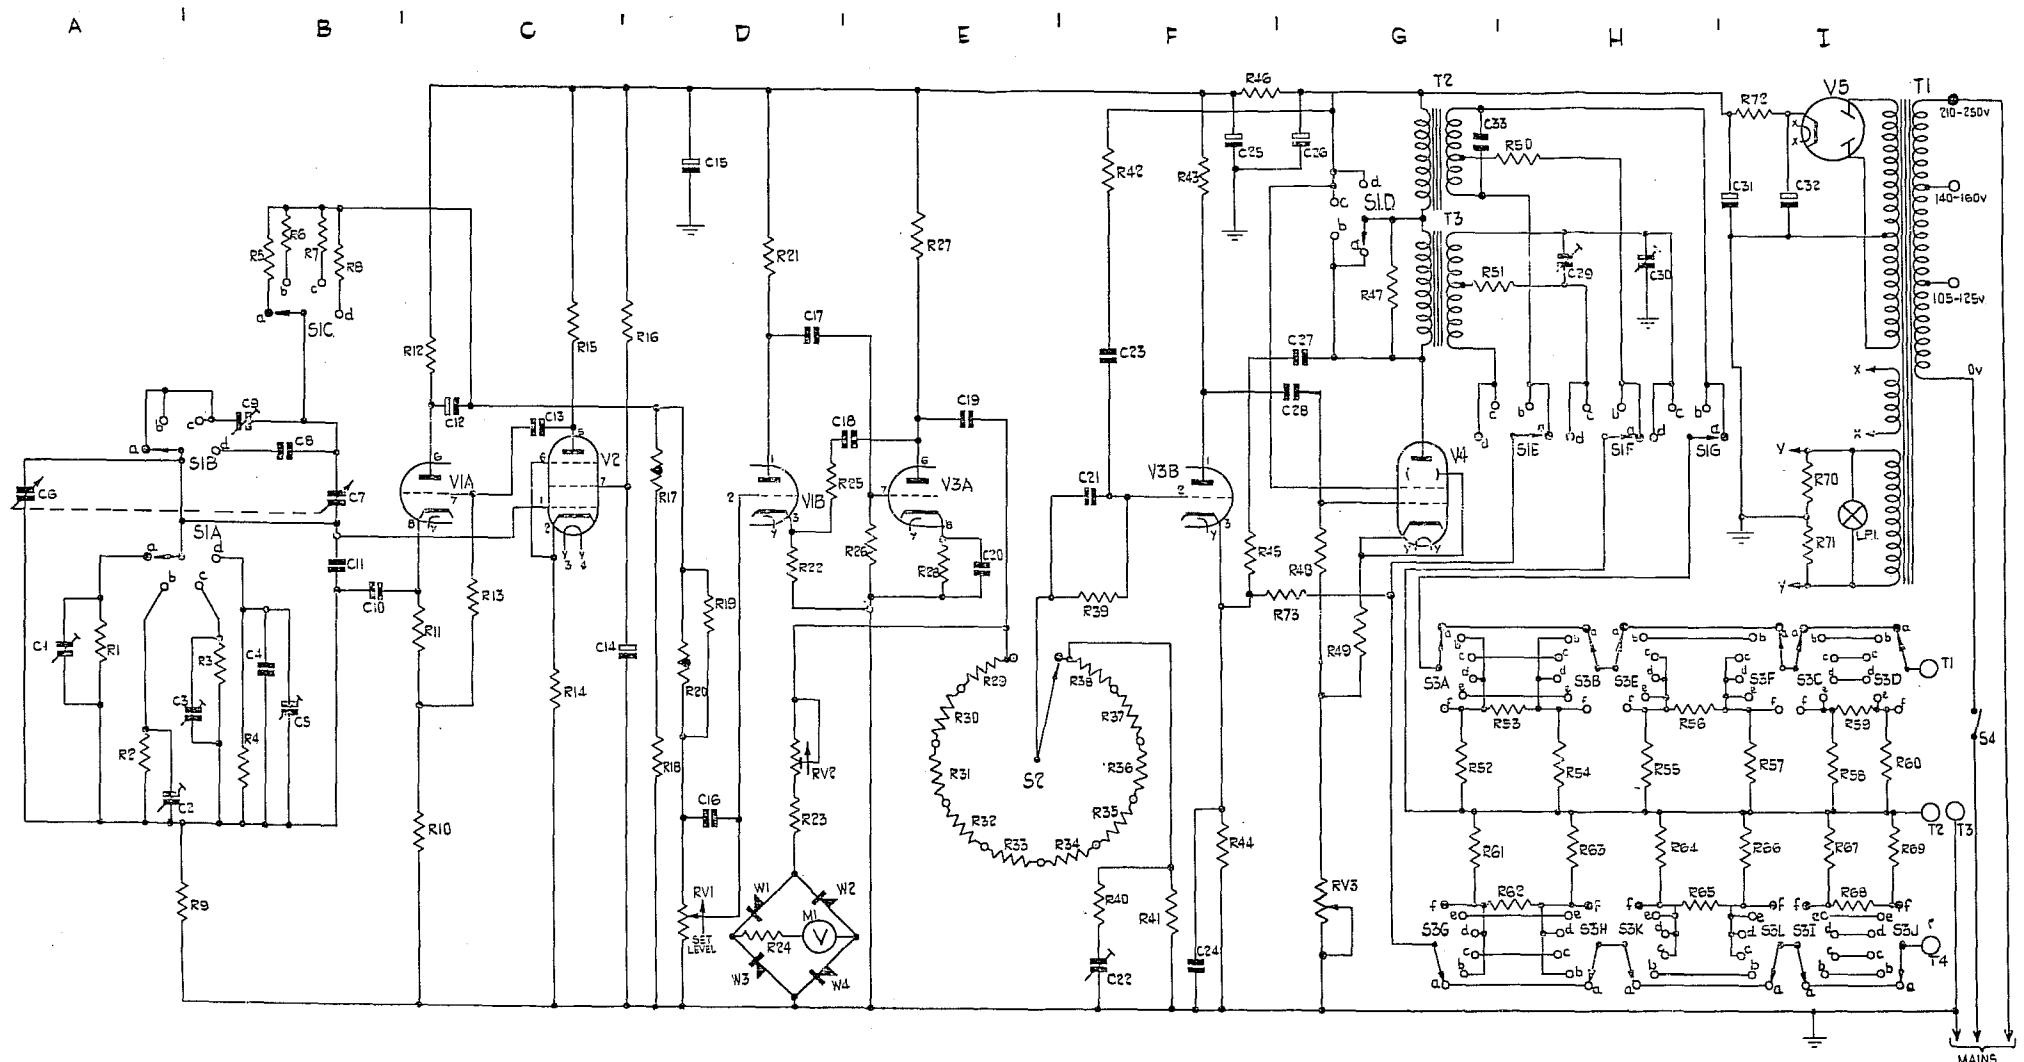

27½ lb (12.5 kg).

DIMENSIONS:

11½ in. (28.5 cm) wide; 15 in. (37.2 cm) high; 8½ in. (21.6 cm) deep.
