## Introduction

The HP-9060 is a passive high impedance oscilloscope probe designed and calibrated for use with instruments having an input impedance of  $1M\Omega$  shunted by  $20pF$ . However, it may be compensated for use with instruments having an input capacitance of  $10$  to  $30pF$ . The probe incorporates a three position slide switch in the head which selects attenuation of  $x1$ ,  $x10$  or a ground reference position.

## Safety Instructions

- Review the following safety precautions to avoid injury and prevent damage to this product or any products connected to it.
- To avoid potential hazards, use this product only as specified.
  - The common terminal is at ground potential. Do not connect the common terminal to elevated voltages.
  - Do not operate in an explosive atmosphere.
  - Keep product surfaces clean and dry.
  - If your probe requires cleaning, disconnect it from the instrument and clean it with mild detergent and water. Make sure the probe is completely dry before reconnecting it to the instrument.

## Compensation Adjustment

The following adjustment is required whenever the probe is transferred from one oscilloscope or input channel to another. Connect the probe to the oscilloscope and select  $x10$  position on the probe switch. Apply a 1KHz square wave to the probe tip, or connect to the cal socket on the oscilloscope to display a few cycles of the waveform and adjust the trimmer located in the BNC box for a flat topped square wave.

### Description

The 100 MHz YT5100 and 60 MHz YT5060 probes can select 1X or 10X attenuation using the switch located on the probe head. Both probes feature 1.5 meter cables. A hooktip, ground lead, and adjustment tool are included. These probes are compatible with any general purpose oscilloscope with an input capacitance between 20pF and 45pF.

### Probe Compensation

Connect the probe to the oscilloscope input and switch the probe to the X 10 position. Connect the probe tip to a square wave signal with an approximate 1KHz repetition rate. Display the signal with 5 divisions of amplitude and several pulses on the oscilloscope screen. Adjust the capacitor at the BNC end of the probe to obtain the flattest response.
