Before Working on Your Computer

This document provides procedures for removing and installing the components in your computer. Unless otherwise noted, each procedure assumes that:

- You have performed the steps in "Before Working on Your Computer" on page 9.
- You have read the safety information that shipped with your computer.
- When replacing a component, you have already removed the original, if installed.

 **NOTE:** The color of your system and certain system components may appear differently than shown in this document.

Recommended Tools

The procedures in this document may require the following tools:

- Small flat-blade screwdriver
- Phillips screwdriver
- Small plastic scribe
- Flash BIOS update (see the Dell Support website at support.dell.com)

Before Working on Your Computer

Use the following safety guidelines to help protect your computer from potential damage and to help to ensure your own personal safety.

 **WARNING:** Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

 **CAUTION:** Only a certified service technician should perform repairs on your computer. Damage due to servicing that is not authorized by Dell is not covered by your warranty.

△ **CAUTION:** When you disconnect a cable, pull on its connector or on its pull-tab, not on the cable itself. Some cables have connectors with locking tabs; if you are disconnecting this type of cable, press in on the locking tabs before you disconnect the cable. As you pull connectors apart, keep them evenly aligned to avoid bending any connector pins. Also, before you connect a cable, ensure that both connectors are correctly oriented and aligned.

△ **CAUTION:** To avoid damaging the computer, perform the following steps before you begin working inside the computer.

- 1 Ensure that the work surface is flat and clean to prevent the computer cover from being scratched.
- 2 Turn off your computer (see "Turning Off Your Computer" on page 10).

△ **CAUTION:** To disconnect a network cable, first unplug the cable from your computer and then unplug the cable from the network device.

- 3 Disconnect all telephone or network cables from the computer.
- 4 Disconnect your computer and all attached devices from their electrical outlets.
- 5 Press and hold the power button while the system is unplugged to ground the system board.

△ **CAUTION:** Before touching anything inside your computer, ground yourself by touching an unpainted metal surface, such as the metal at the back of the computer. While you work, periodically touch an unpainted metal surface to dissipate static electricity, which could harm internal components.

Turning Off Your Computer

△ **CAUTION:** To avoid losing data, save and close all open files and exit all open programs before you turn off your computer.

- 1 Shut down the operating system.
- 2 Ensure that the computer and all attached devices are turned off. If your computer and attached devices did not automatically turn off when you shut down your operating system, press and hold the power button for about 4 seconds to turn them off.

3 If you are installing a new card, remove the filler bracket covering the empty card slot. To remove a filler bracket, gently insert a scribe under the top edge of the bracket.

4 If you are replacing a card that is already installed in the computer, remove the card. If necessary, disconnect any cables connected to the card.

- For a PCI card, grasp the card by its top corners, and ease it out of its connector.
- For a PCI Express card, pull the securing tab, grasp the card by its top corners, and ease it out of its connector.

5 If your card includes a card retention bar, remove the bar. Gently pull the securing tab, grasp the card by its top corners, and ease it out of its connector.

6 Prepare the new card for installation.

 **NOTE:** For information on configuring the card, making internal connections, or customizing it for your computer, see the documentation that came with the card.

 **WARNING:** Some network adapters automatically start the computer when they are connected to a network. To guard against electrical shock, be sure to unplug your computer from its electrical outlet before installing any cards.

- 7 If you are installing the card into the PCI Express x16 card connector, position the card so that the securing slot is aligned with the securing tab, and gently pull the securing tab.

 - The notch the top of the card or filler bracket fits around the alignment guide.

1 alignment guides (4)

10 Secure the card(s) by closing the card retention latch and snapping it into place.

△ CAUTION: Do not route card cables over or behind the cards. Cables routed over the cards can prevent the computer cover from closing properly or cause damage to the equipment.

11 Connect any cables that should be attached to the card.

For information about the card's cable connections, see the documentation the card.

12 Follow the procedure in "After Working on Your Computer" on page 17.

13 If you installed a network adapter card and want to turn off the integrated network adapter, use the system setup program. For more information on using the system setup program, see the *Dell Technology Guide* on your computer or at support.dell.com.

△ CAUTION: If your computer supports Active Management Technology (AMT), disabling the integrated network adapter also disables AMT functionality.

- 14 Install any drivers required for the card as described in the card documentation.

Processor Heat-Sink Assembly

 **WARNING:** Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

 **WARNING:** To guard against likelihood of electric shock, laceration by moving fan blades or other unexpected injuries, always unplug your computer from the electrical outlet before removing the cover.

Removing the Processor Heat-Sink Assembly

 **CAUTION:** Unless a new heat sink is required for the new processor, reuse the original heat-sink assembly when you replace the processor.

- 1 Follow the procedure in "Before Working on Your Computer" on page 9.
- 2 Remove the computer cover (see "Removing the Mini Tower Computer Cover" on page 19 or "Removing the Desktop Computer Cover" on page 21).
- 3 Disconnect the heat-sink assembly power cable from the system board.
- 4 Loosen the two captive screws securing the heat-sink assembly to the system board.

 **WARNING:** Despite having a plastic shield, the heat-sink assembly may become very hot during normal operation. Allow sufficient time for it to cool before you touch it.

 **CAUTION:** A strong thermal solution bond may exist between the processor and heat sink. Do not use excessive force to separate the heat-sink assembly from the processor to avoid damaging the processor.

- 5 Rotate the heat-sink assembly outward on its hinges, away from the screw holes, detach it from the hinges, and lift it out of the computer chassis.
- 6 Lay the heat-sink assembly down on its top, with the thermal grease facing upward.

Replacing or Adding a Memory Module

CAUTION: Do not install ECC memory modules.

CAUTION: If you remove the original memory modules from the computer during a memory upgrade, keep them separate from any new modules that you may have, even if you purchased the new modules from Dell. Match the specifications of the memory modules you are installing. Otherwise, your computer may not start properly.

NOTE: If you install mixed pairs of PC2-5300 (DDR2 667-MHz) and PC2-6400 (DDR2 800-MHz) modules, the modules function at the speed of the slowest module installed. The specifications for the memory module are listed on a label on the module.

NOTE: This procedure assumes that you have completed the removal procedure first.

- 1 Install a single memory module in the connector labeled "DIMM1," the connector closest to the processor, before you install modules in any other connector.

Align the notch on the bottom of the module with the crossbar in the connector.

- | | | | |
|---|-------------|---|---------------|
| 1 | cutouts (2) | 2 | memory module |
| 3 | notch | 4 | crossbar |

CAUTION: To avoid damage to the memory module, press the module straight down into the connector while you apply equal force to each end of the module.

- 2 Insert the module into the connector until the module snaps into position. If you insert the module correctly, the securing clips snap into the cutouts at each end of the module.

- 3 Follow the procedure in "After Working on Your Computer" on page 17.
- 4 When the message appears stating that memory size has changed, press <F1> to continue.
- 5 Log on to your computer.
- 6 Right-click the My Computer icon on your Windows[®] desktop, and select Properties.

- 7 Click the **General** tab, and verify that the amount of memory (RAM) listed is correct.
- 8 You can also enter the system setup program to verify the new memory is recognized by the computer. For more information on using the system setup program, see the *Dell Technology Guide* on your computer or at support.dell.com.

Coin-Cell Battery

 **WARNING:** Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

 **WARNING:** A new battery can explode if it is incorrectly installed. Replace the battery only with the same or equivalent type recommended by the manufacturer. Discard used batteries according to the manufacturer's instructions.

A coin-cell battery maintains computer configuration, date, and time information. The battery can last several years. If you have to repeatedly reset time and date information after turning on the computer, replace the battery.

Removing the Coin-Cell Battery

- 1 Record the information on the screens in the system setup program so that you can restore the correct settings in step 4 of "Replacing the Coin-Cell Battery" on page 94. For more information on using the system setup program, see the *Dell Technology Guide* on your computer or at support.dell.com.
- 2 Follow the procedure in "Before Working on Your Computer" on page 9.
- 3 Remove the computer cover (see "Removing the Mini Tower Computer Cover" on page 19 or "Removing the Desktop Computer Cover" on page 21).
- 4 Locate the battery socket on the system board (see "System Board Components" on page 13).

 **CAUTION:** If you pry the battery out of its socket with a blunt object, be careful not to touch the system board with the object. Ensure that the object is inserted between the battery and the socket before you attempt to pry out the battery. Otherwise, you may damage the system board by prying off the socket or by breaking circuit traces on the system board.

1 battery (positive side) 2 battery retention tab

- 5 Insert a plastic scribe between the battery retention tab and the battery, and gently pry the battery loose.

Troubleshooting

Tools

Power Lights

 **WARNING:** Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

 **WARNING:** Always unplug your computer from the electrical outlet before opening the cover.

The power button light located on the front of the computer illuminates and blinks or remains solid to indicate different states:

- If the power light is green and the computer is not responding, see "Beep Codes" on page 124.
- If the power light is blinking green, the computer is in standby mode. Press a key on the keyboard, move the mouse, or press the power button to resume normal operation.
- If the power light is off, the computer is either turned off or is not receiving power.
 - Reseat the power cable into both the power connector on the back of the computer and the electrical outlet.
 - If the computer is plugged into a power strip, ensure the power strip is plugged into an electrical outlet and the power strip is turned on.
 - Bypass power protection devices, power strips, and power extension cables to verify if the computer turns on properly.
 - Ensure the electrical outlet is working by testing it with another device, such as a lamp.
 - Ensure the main power cable and front panel cable are securely connected to the system board (see "System Board Components" on page 13).

- If the power light is blinking amber, the computer is receiving electrical power, but an internal power problem may exist.
 - Ensure the voltage selection switch is set to match the AC power at your location, if applicable.
 - Ensure the processor power cable is securely connected to the system board (see "System Board Components" on page 13).
- If the power light is steady amber, a device may be malfunctioning or incorrectly installed.
 - Remove and reinstall the memory modules (see "Replacing or Adding a Memory Module" on page 90).
 - Remove and reinstall any cards (see "Cards" on page 29).
- Eliminate interference. Some possible causes of interference are:
 - Power, keyboard, and mouse extension cables
 - Too many devices on a power strip
 - Multiple power strips connected to the same electrical outlet

Beep Codes

Your computer might emit a series of beeps during start-up if the monitor cannot display errors or problems. This series of beeps, called a beep code, identifies a problem. For example, beep code 1-3-1 (one possible beep code) consists of one beep, a burst of three beeps, and then one beep. This beep code tells you that the computer encountered a memory problem.

Reseating the memory modules may correct the following beep code errors. If the problem persists, contact Dell™ (see "Contacting Dell" on page 159) for obtaining technical assistance.

Code	Cause
1-3-1 through 2-4-4	Memory not being properly identified or used
4-3-1	Memory failure above address 0FFFFh

If your computer emits a series of beeps during start-up:

- 1 Write down the beep code.

- 2 Run the Dell™ Diagnostics to further identify the problem. (see "Dell Diagnostics" on page 136).

Diagnostic Lights

WARNING: Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the **Regulatory Compliance Homepage** on www.dell.com at www.dell.com/regulatory_compliance.

To help troubleshoot a problem, your computer has four lights labeled 1, 2, 3, and 4 on the front panel.

NOTE: If you are using an ultra small form factor computer, the diagnostic lights are present on the back panel. See the *Setup and Quick Reference Guide* that ships with your computer for more information.

When the computer starts normally, the lights flash, and then turn off. If the computer malfunctions, use the sequence of the lights to help identify the problem.

NOTE: After the computer completes POST, all four lights turn off before booting to the operating system.

Dell Diagnostics

WARNING: Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

When to Use the Dell Diagnostics

If you experience a problem with your computer, perform the checks in this section, and then run the Dell™ Diagnostics before contacting Dell for assistance.

Start the Dell Diagnostics from your hard drive or from the *Drivers and Utilities* disc provided with your computer.

NOTE: The *Drivers and Utilities* disc is optional and may not ship with your computer.

NOTE: The Dell Diagnostics only operate on Dell computers.

Starting the Dell Diagnostics From Your Hard Drive

Before running the Dell Diagnostics, enter the system setup program to review your computer's configuration information, and ensure the device you want to test is displayed and active in the system setup program. For more information on using the system setup program, see the *Dell Technology Guide* on your computer or at support.dell.com.

The Dell Diagnostics is located on a separate diagnostic utility partition on your hard drive.

NOTE: If your computer does not display a screen image, contact Dell (see "Contacting Dell" on page 159).

- 1 Ensure the computer is connected to an electrical outlet that is known to be working properly.

Solving Problems

Follow these tips when troubleshooting your computer:

- If you added or removed a part before the problem started, review the installation procedures and ensure that the part is correctly installed.
- If a peripheral device does not work, ensure that the device is properly connected.
- If an error message appears on the screen, write down the exact message. This message may help support personnel diagnose and fix the problem(s).
- If an error message occurs in a program, see the program's documentation.

NOTE: The procedures in this document were written for the Windows default view, so they may not apply if you set your Dell computer to the Windows Classic view.

Battery Problems

WARNING: There is a danger of a new battery exploding if it is incorrectly installed. Replace the battery only with the same or equivalent type recommended by the manufacturer. Discard used batteries according to the manufacturer's instructions.

WARNING: Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

REPLACE THE BATTERY — If you have to repeatedly reset time and date information after turning on the computer, or if an incorrect time or date displays during start-up, replace the battery (see "Coin-Cell Battery" on page 93). If the battery still does not work properly, contact Dell (see "Contacting Dell" on page 159).

Drive Problems

WARNING: Before working inside your computer, read the safety information that shipped with your computer. For additional safety best practices information, see the Regulatory Compliance Homepage at www.dell.com/regulatory_compliance.

ENSURE MICROSOFT WINDOWS RECOGNIZES THE DRIVE —

Windows XP:

- Click Start and click My Computer.

Windows Vista:

- Click the Windows Vista Start button  and click Computer.

If the drive is not listed, perform a full scan with your antivirus software to check for and remove viruses. Viruses can sometimes prevent Windows from recognizing the drive.

TEST THE DRIVE —

- Insert another disc to eliminate the possibility that the original drive is defective.
- Insert a bootable floppy disc and restart the computer.

CLEAN THE DRIVE OR DISK — See the *Dell Technology Guide* on your computer or at support.dell.com.

RUN THE HARDWARE TROUBLESHOOTER — See "Hardware Troubleshooter" on page 135.

RUN THE DELL DIAGNOSTICS — See "Dell Diagnostics" on page 136.

Optical drive problems

NOTE: High-speed optical drive vibration is normal and may cause noise, which does not indicate a defect in the drive or the disc.

NOTE: Because of different regions worldwide and different disc formats, not all DVD titles work in all DVD drives.

ADJUST THE WINDOWS VOLUME CONTROL —

- Click the speaker icon in the lower-right corner of your screen.
- Ensure that the volume is turned up by clicking the sidebar and dragging it up.
- Ensure that the sound is not muted by clicking any boxes that are checked.

CHECK THE SPEAKERS AND SUBWOOFER — See "Sound and Speaker Problems" on page 153.

Problems writing to an optical drive

CLOSE OTHER PROGRAMS — The optical drive must receive a steady stream of data during the writing process. If the stream is interrupted, an error occurs. Try closing all programs before you write to the optical.

TURN OFF STANDBY MODE IN WINDOWS BEFORE WRITING TO A DISC — See the *Dell Technology Guide* on your computer or at support.dell.com, or search for the keyword *standby* in Windows Help and Support for information on power management modes.
