

2A Pneumatic Cylinders

Steel-bodied tie rod cylinders for
working pressures up to 18 bar

aerospace
climate control
electromechanical
filtration
fluid & gas handling
hydraulics
pneumatics
process control
sealing & shielding

ENGINEERING YOUR SUCCESS.

2A Cylinder Mounting Styles

The standard range of Parker 2A cylinders comprises 15 mounting styles, to suit the majority of applications. General guidance for the selection of the cylinders is given below, with dimensional information about each mounting style shown on pages 8 to 20 for 25.4mm to 152.4mm (1" to 6") bore sizes, and pages 22 to 30 for 203.2mm to 355.6mm (8" to 14") bore sizes.

Application-specific mounting information is shown on pages 36 and 37.

Where a non-standard mounting style is required to satisfy a particular application, our design engineers will be happy to assist. Please contact the factory for details.

Introduction

The heavy duty series 2A pneumatic cylinders described in this catalogue are of all-steel construction and are based on the Parker series 3L hydraulic range – see catalogue HY07-1130.

They are exceptionally robust and are ideally suited for applications in steel mills, foundries, aluminium smelting plants or other arduous environments where normal light duty aluminium cylinders are not sufficiently durable. In addition to the standard cylinders featured in this catalogue, 2A cylinders can be designed to suit customer requirements. Our engineers will be pleased to advise on unique designs to suit specific applications.

inPHorm

European Cylinder inPHorm is Parker Hannifin's product selection program that helps to select the correct part for an application. The program prompts for the details of the application, makes the necessary design calculations, and selects a suitable product. inPHorm can also generate CAD drawings of the selected part, which can be viewed in other software applications, and customised and imported into other CAD packages. Please contact your local sales office (see rear cover) for further information.

Parker Offers the Widest Range of Industrial Cylinders**High Productivity – Low Cost of Ownership**

Parker Hannifin's Cylinder Division is the world's largest supplier of hydraulic cylinders for industrial applications.

Parker manufactures a vast range of standard and special tie rod, roundline and 'mill' type cylinders to suit all types of industrial cylinder applications. Our cylinders are available to ISO, DIN, NFPA, ANSI and JIC standards, with other certifications available on request. All Parker hydraulic and

heavy duty pneumatic cylinders are designed to deliver long, efficient service with low maintenance requirements, guaranteeing high productivity year after year.

About Parker Hannifin

Parker Hannifin is the global leader in motion and control technologies, partnering with its customers to increase their productivity and profitability. The company employs more than 57,000 people in 43 countries around the world, providing customers with technical excellence and first class customer service.

Warning

FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS AND/OR SYSTEMS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

This document and other information from Parker Hannifin Corporation, its subsidiaries, sales offices and authorized distributors provide product or system options for further investigation by users having technical expertise. Before you select or use any product or system it is important that you analyse all aspects of your application and review the information concerning the product or system in the current product catalogue. Due to the variety of operating conditions and applications for these products or systems, the user, through his own analysis and testing, is solely responsible for making the final selection of the products and systems and assuring that all performance and safety requirements of the application are met.

The products described herein, including without limitation, product features, specifications, designs, availability and pricing, are subject to change by Parker Hannifin Corporation and its subsidiaries at any time without notice.

Offer of Sale

Please contact your local Parker representative for a detailed offer of sale.

**1 Piston Rod**

Gland seal life is maximised by manufacturing piston rods from precision ground, high tensile carbon alloy steel, hard chrome plated and polished to 0.2µm max. Piston rods are induction case hardened to Rockwell C54 minimum before chrome plating, resulting in a dent-resistant surface.

2 Rod Gland

The rod gland, complete with rod seals, can easily be removed without dismantling the cylinder, so servicing is quicker – and therefore more economical.

3 Rod Seals

The serrated lipseal has a series of sealing edges which take over successively as pressure increases, providing efficient sealing under all operating conditions. On the return stroke the serrations act as a check valve.

The double lip wiperseal acts as a secondary seal, cleaning the rod on the return stroke. Its outer lip prevents the ingress of dirt into the cylinder, extending the life of gland and seals.

**Non-Lubricated Rod Seals**

For non-lubricated air cylinders, rod seals with special rounded sealing lips are supplied as standard. Specify series 2AN (see pages 34-35).

4 Cylinder Body

The surface of the cylinder bore is finished to minimise internal friction and prolong seal life. The bore of the cylinder is hard chrome-plated to prevent corrosion and extend the life of the cylinder.

5 Cylinder Body Seals

To ensure that the cylinder body remains leak free, even under pressure shock conditions, Parker fits pressure-energised body seals.

6 Piston

Lipseal pistons are fitted as standard to 2A cylinders. All pistons are of one-piece type, and feature wide bearing surfaces to resist side loading. Long thread engagement secures the piston to the piston rod and, for additional safety, the piston is secured by thread-locking adhesive and a locking pin.

7 Cushioning

End of stroke deceleration is available by using straight cushions at the head and cap – see page 41 for details. The head and cap end cushions are self-centring. The polished cap end spear is an integral part of the piston rod.

8 Floating Cushion Bushes & Sleeves

Cushioning is provided by the use of a floating cushion sleeve at the head end of the cylinder, and a floating cushion bush at the cap end. The use of a check valve in the head and lifting of the bronze cushion bush in the cap, provides minimum flow restriction at the start of the return stroke. This allows full pressure to be applied over the whole area of the piston, to provide full power and fast cycle times.

9 Cushion Adjustment

Needle valves are provided at both ends of the cylinder for precise cushion adjustment, and retained within the head and cap so that they cannot be inadvertently removed. The cartridge type needle valve illustrated below is fitted to cylinders of up to 63.5mm (2½") bore – see page 42.

**10 Check Valve**

A check valve is provided at the head end of the cylinder, providing minimum flow restriction at the start of the return stroke. This allows full pressure to be applied to the annular area of the piston, permitting faster cycle times.

**Piston Seals**

Lipseal Pistons – A Lipseal piston is fitted to 2A cylinders as standard. It offers a wide piston surface which reduces bearing load, and is suitable for speeds of up to 0.5m/s. Fully dynamic and self-compensating seals allow for variations in pressure, mechanical deflections and wear.

Non-Lubricated Pistons – For non-lubricated air cylinders, lipseals with special rounded sealing lips are supplied as standard. Specify Series 2AN (see pages 34-35).

Seal Groups

Parker offers two classes of seals for 2A and 2AN (non-lubricated air) cylinders:

Group 1 Seals are standard and are suitable for air or nitrogen. The temperature range for Group 1 seals is -20°C to +80°C.

Group 5 Seals are made from fluorocarbon elastomers and extend the working temperature for 2A cylinders from -15°C up to 150°C, or 204°C with reduced life. For non-lubricated air cylinders in high temperature applications, please refer to page 35.

Special Designs

Parker's design and engineering staff are available to produce special designs to meet customer's specific requirements. Alternative sealing arrangements, special mounting styles, different bores and rod sizes are just a few of the custom features which can be supplied.

Standard Specifications

- Heavy-duty service – NFPA specifications
- Standard construction – square head – 4 tie rod design
- Standard pressure – to 18 bar (250 psi) dependent on bore size
- Standard medium – filtered and lubricated air
- Standard temperature – -20°C to +80°C
- Hard chrome-plated bore
- Bore sizes – 25.4mm (1") to 355.6mm (14")
- Piston rod diameters – 12.7mm (½") to 139.7mm (5½")
- Mounting styles – 15 standard styles
- Strokes – available in any practical stroke length
- Cushions – optional at either end or both ends of stroke
- Rod ends – three standard choices – specials to order

Check List

The following check list indicates the principal factors which should be considered when selecting a pneumatic cylinder for a particular application. Further information is available on the pages shown. If more detailed information is required about any aspect of a cylinder's specification, please contact our design engineers who will be happy to assist.

inPHorm

The European Cylinder inPHorm program can assist with the selection and specification of an hydraulic cylinder for a particular application. Please ask for HY07-1260/Eur.

- 1 Establish System Parameters Series 2A**
 – Weight to be moved and force required
 – Nominal operating pressure and range
 – Distance to be travelled
 – Average and maximum piston speed

- 2 Mounting Style Page 7**
 Select the appropriate style for the specific application

- 3 Cylinder Bore and Operating Pressure Pages 37, 38**
 Determine the bore and system pressure required to provide the necessary force

- 4 Piston Rod Pages 20, 30, 38, 39, 40**
 Single or double rod?
 Determine the minimum rod diameter required to withstand buckling forces
 Is a stop tube required?
 Select a suitable rod end and rod end thread
 Check pressure rating of selected cylinder and piston rod

- 5 Piston Page 5**
 Does seal type suit application?
 (eg: Lipseal for 2A cylinders, Non-Lubricated for 2AN cylinders)

- 6 Cushioning Page 41**
 Select cushioning requirements if applicable

- 7 Ports Page 42**
 Select suitable ports
 Are the standard positions acceptable?

- 8 Seals Page 5**
 Select seals to suit the chosen temperature range

- 9 Rod and Cap End Accessories Pages 31-33**
 Are rod end and/or cap end accessories required?

- 10 Optional Features Page 43**
 Removable trunnions, rod end bellows etc.

Mounting Styles and Where to Use Them

See also application-specific mounting information on page 36.

Extended Tie Rod Mountings – Styles TB, TC and TD**Application**

- straight line force transfer
- compression (push) – use cap end mountings TC or TD
- tension (pull) – use head end mountings TB or TD

Benefits

- ease of mounting where space is limited
- high efficiency – force is absorbed on cylinder's centre line
- TD double-ended mounting allows brackets or switches to be attached to cylinder

**Styles TB, TC, TD**

See pages 8-9, 22-23

TB**Flange Mountings – Styles J, JB, H, HB****Application**

- straight line force transfer
- compression (push) – use cap end mounting HH or HB
- tension (pull) – use head end mounting J or JB

Benefits

- exceptionally rigid mounting due to large flange area
- high efficiency – force is absorbed on cylinder's centre line

**Styles J, JB, H, HB**

See pages 10-13, 24

J**Foot Mounting – Styles C, F, G****Application**

- straight line force transfer
- suitable for push or pull applications
- force is **not** absorbed on centre line – secure attachment is vital, eg: a thrust key where applicable (page 36) and effective load guidance

Benefits

- ease of mounting and adjustment

**Styles C, F, G**

See pages 14-15, 26-27

C**Pivot Mountings – Styles BB and BC****Application**

- curved path force transfer
- movement in a single plane – use fixed clevis styles BB or BC

Benefits

- ease of attachment – use with plain or spherical bearing at rod end
- greater flexibility for the machine designer
- self-alignment resists wear of cylinder's bearing surfaces

**Styles BB, BC**

See pages 16-17, 25

BB**Trunnion Mountings – Styles D, DB and DD****Application**

- curved path force transfer
- movement in a single plane
- compression (push) – use DB or DD mountings
- tension (pull) – use D or DD mountings

Benefits

- greater flexibility for the machine designer
- self-alignment resists wear of cylinder's bearing surfaces
- high efficiency – force is absorbed on cylinder's centre line
- ease of attachment – use with pivot mounting at rod end

**Styles D, DB, DD**

See pages 18-19, 28-29

DB

**Style TB**Tie Rods Extended Head End
(NFFPA Style MX3)

See Notes 1, 2, 3, 4, 5

**Style TC**Tie Rods Extended Cap End
(NFFPA Style MX2)

See Notes 1, 2, 3, 4, 5

**Dimensions TB, TC & TD** See also Rod End Dimensions, page 20

All dimensions are in millimetres unless otherwise stated.

**Style TD**Tie Rods Extended Both Ends
(NFFPA Style MX1)

See Notes 1, 2, 3, 4, 5

**Notes**

- 1 All tie rod threads (dimension DD) are UNF, with the exception of 25.4mm (1") bore which is UNC.
- 2 Mounting nuts should be tightened to the torque values shown for tie rod nuts – see page 37.
- 3 For Styles TB and TC an additional set of mounting nuts are supplied. For Style TD, two additional sets of mounting nuts are supplied.
- 4 The extra height 'H' of the port face applies to the head end of the bore and rod sizes shown in the table below and to the cap end of 38.1mm (1½") bore cylinders only.
- 5 R1 size BSPP ports to ISO 228/1 are supplied as standard on 2A cylinders. For smaller R2 size ports, please see page 42.

**Style G**Side End Lug
(NFFA Style MS7)

See Notes 1, 4, 5, 6

**Notes**

- 1 Consider the use of a thrust key with this mounting – see page 36.
- 2 Tapped mounting holes are metric (coarse pitch series).
- 3 Upper surfaces of lugs are machined for socket head screws.
- 4 Not available in 25.4mm (1") bore sizes.
- 5 The extra height 'H' of the port face applies to the head end of the bore and rod sizes shown below and to the cap end of 38.1mm (1½") bore cylinders only.
- 6 R1 size BSPP ports to ISO 228/1 are supplied as standard on 2A cylinders. For smaller R2 size ports, please see page 42.

**Style BC**

Cap Detachable Clevis
(NFFPA Style MP2)

See Notes 1, 2, 3, 4

Notes

- 1 Dimension CD is the pivot pin diameter except for 25.4mm (1") bore. Style BB and BC cylinders of 38.1mm (1½") bores and above are supplied complete with a pivot pin.
- 2 On 25.4mm (1") bore size styles BB and BC a single lug is fitted, as shown above. Dimension CD is the crosshole diameter – the pivot pin is not included.
- 3 The extra height 'H' of the port face applies to the head end of the bore and rod sizes shown below and to the cap end of 38.1mm (1½") bore cylinders only.
- 4 R1 size BSPP ports to ISO 228/1 are supplied as standard on 2A cylinders. For smaller R2 size ports, please see page 42.

Notes

- Note the minimum stroke from the table below.
- XI dimension to be specified by customer. Please note minimum dimension from the table below.
- Not available in 25.4mm (1") bore size.
- R1 size BSPP ports to ISO 228/1 are supplied as standard on 2A cylinders. For smaller R2 size ports, please see page 42.
- The extra height 'H' of the port face applies to the head end of the bore and rod sizes shown below and to the cap end of 38.1mm (1½") bore cylinders only.

**Rod End Details – 25.4mm to 152.4mm
(1" to 6") bore sizes only**

Piston Rod End Data for 203.2mm to 355.6mm (8" to 14") bore size cylinders is shown on page 30.

Rod End Styles 4 & 8

Style 4 rod ends are recommended for all applications in which the work piece is secured against the rod shoulder. Where the work piece is not shouldered, Style 8 rod ends are recommended. If a rod end style is not specified, Style 4 will be supplied.

Rod End Style 9

For applications where a female thread is required.

Rod End Style 3

Non-standard piston rod ends are designated 'Style 3'. A dimensional sketch or description should accompany the order. Please specify dimensions KK or CC, and A.

Rod End Style 4**Rod End Style 8****Rod End Style 9****Rod End Dimensions – 25.4mm to 152.4mm (1" to 6") bore sizes**

¹ All rod threads are UNF except 1-14 which is UNS.

All dimensions are in millimetres unless otherwise stated.

**Double Rod Cylinders – 25.4 to 152.4mm Bore Sizes**

Available with styles TB, TD, J, JB, C, F, G, D, DD

**Double Rod Cylinders – 203.2 to 355.6mm Bore Sizes**

Available with styles TB, TD, JB, C, F, G, D, DD

Mounting Styles and Codes

Double rod cylinders are denoted by a 'K' in the model code, shown on page 47.

Dimensions

To obtain dimensional information for double rod cylinders, first select the desired mounting style by referring to the corresponding single rod models shown on the preceding pages. Dimensions for the appropriate single rod model should be supplemented by those from the table opposite to provide a full set of dimensions.

Rod Strength

Double rod cylinders employ two separate piston rods, with one screwed into the end of the other within the piston rod assembly. As a result, one piston rod is stronger than the other. The stronger rod is identified by the letter 'K' stamped on its end.

Combination Rods

Double rod cylinders with rods of differing rod diameters are also available. Please contact the factory for details.

Cushioning

Double rod cylinders can be supplied with cushions at either or both ends. Cushioning requirements should be specified by inserting a 'C' in the ordering code – see page 47. Double rod cylinders that require cushioning are supplied with floating cushion sleeves at both ends.

Style 9 Rod Ends

If a stroke of less than 25mm on bore sizes up to 82.6mm (3 1/4"), or a stroke of less than 100mm on bore sizes of 101.6mm (4") and over, is required, where Style 9 rod ends are required at both ends, please consult the factory.

Tie Rods Extended Both Ends
(NFFA MX1)

See Notes 1, 2, 3

Notes

- 1 All tie rod threads are UNF.
- 2 For Styles TB and TC an additional set of mounting nuts are supplied. For Style TD, two additional sets of mounting nuts are supplied.
- 3 R1 size BSPP ports to ISO 228/1 are supplied as standard on 2A cylinders. For smaller R2 size ports, please see page 42.

Style G
Side End Lugs
(NFFA Style MS7)

See Note 2, 3, 5

Notes

- 1 Upper surfaces of lugs are machined for socket head screws.
- 2 Mounting style G is not available on 203.2mm (8") bores with rod numbers 2, 6, 7, 8 and 0, and 254.0mm (10") bores with rod numbers 9 and 0.
- 3 When using mounting Style G, check clearance between mounting members and rod attachment or accessory. If necessary, specify longer rod extension to avoid interference with mounting member.
- 4 Tapped mounting holes are metric (coarse pitch series).
- 5 R1 size BSPP ports to ISO 228/1 are supplied as standard on 2A cylinders. For smaller R2 size ports, please see page 42.

**Rod End Details – 203.2mm to 355.6mm
(8" to 14") bore sizes**

Piston Rod End Data for 25.4mm to 152.4mm (1" to 6") bore size cylinders is shown on page 20.

Rod End Style 4

Rod End Style 8

Rod End Style 9

Rod End Styles 4 & 8

Style 4 rod ends are recommended for all applications in which the work piece is secured against the rod shoulder. Where the work piece is not shouldered, Style 8 rod ends are recommended. If rod end style is not specified, Style 4 will be supplied.

Rod End Style 9

For applications where a female thread is required.

Rod End Style 3

Non-standard piston rod ends are designated 'Style 3'. A dimensional sketch or description should accompany the order. Please specify dimensions KK or CC, and A.

¹ All rod threads are UNF except 1-14 which is UNS.

All dimensions are in millimetres unless otherwise stated.

Accessory Selection

Accessories for the rod end of a cylinder are selected by reference to the rod end thread, shown on pages 20 and 30, while the same accessories, when used at the cap end, are selected by cylinder bore size. See tables of part numbers below and on the following pages.

Pivot Pin Diameters – Style BB

To obtain the same diameter of pivot pin at the rod end and cap end of a style BB clevis-mounted cylinder fitted with a rod clevis or plain rod eye, a no. 1 rod should be specified.

Rod and Cap End Accessories

Accessories for the 2A cylinder comprise:

- Rod End** – rod clevis, eye bracket and pivot pin
– plain rod eye, clevis bracket and pivot pin

- Cap End** – eye bracket for style BB mounting

Clevis Bracket

All dimensions are in millimetres unless otherwise stated.

**Series 2AN Non-Lubricated Air Cylinders**

Increased market demand and Parker's continuous research and testing efforts inspired the development of the Series 2AN Non-Lubricated Air Cylinder, suitable for use with filtered air.

These cylinders are designed to operate in environments where it is not possible to add lubrication to the compressed air entering the cylinder. Certain packaging and assembly operations, food environments, and microprocessor chip manufacturing are typical examples of applications where the exhausting of oil into the environment is not desirable.

Available in bore sizes up to 304.8mm (12") diameter and rod diameters up to 63.5mm (2½"), the Series 2AN cylinder features rounded lip rod and piston seals.

Rounded Lipseal

The rounded sealing lip glides over lubricant film instead of scraping it off, and the increased heel thickness and outer lip extension improve stability and resist rolling. The use of the rounded lipseal reduces friction, increases life and eliminates the need for added lubrication.

**Design Features and Benefits**

For the standard features shown above, please see pages 4 and 5. For available bore and rod sizes, please see table opposite.

Benefits of the 2AN Series cylinder include long seal and bearing life and, since no oil is added through the use of lubricators, no oil is expelled into the atmosphere with the exhaust air as the cylinder strokes. In addition, the use of non-lubricated air results in lower overall operating costs.

With the exception of fluorocarbon elastomer seals, and unless otherwise stated, all modifications available with Series 2A Cylinders are also available with Series 2AN cylinders.

Operating Temperatures

The temperature range for Series 2AN cylinders with Group 1 seals is -20°C to +80°C. Group 5, high temperatures seals, are suitable for operating temperatures between -15°C and +150°C.

Ordering Information

To order a Non-Lubricated Air Cylinder, specify Series 2AN. See page 47 for the ordering code.

Available Bore and Rod Sizes

The following bore and rod sizes are available with Series 2AN cylinders. For all other sizes, please contact the factory.

Bore Ø	Rod Number	Rod Diameter MM
25.4 (1")	1	12.7 (½")
	2	15.9 (⅝")

Replacement Parts for 2AN Cylinders

Service Assemblies and Seal Kits

Service Assembly Kits and Seal Kits for 2AN cylinders simplify the ordering and maintenance processes. This page lists only those kits specific to 2AN Series cylinders. For standard Series 2A cylinder service kits, please refer to page 45. They contain sub-assemblies which are ready for installation, and are supplied with full instructions. When ordering Service Assemblies and Seal Kits, please refer to the identification plate on the cylinder body and supply the following information:

Serial Number - Bore - Stroke - Model Number - Fluid Type

Key to Part Numbers

(For all other part numbers, please refer to page 44).

- 14 Gland/bearing cartridge
- 17 Piston
- 40 Wiperseal – for gland
- 41 Rounded Lipseal – for gland
- 42 Rounded Lipseal – for piston
- 45 O-ring – gland/head

2AN Gland Cartridge and Seals

Lipseal Piston

Seal Groups

Group 1 Seal Kits are supplied as standard. Special seals are available for 2AN Series cylinders in high temperature (Group 5) applications – please contact the factory for details.

Ordering Information

To order a non-lubricated air cylinder, specify '2AN' in the order code on page 47.

Tie Rod Torques

Please refer to the table on page 37.

Repairs

Although 2AN cylinders are designed to make on-site maintenance or repairs as easy as possible, some operations can only be carried out in our factory. It is standard policy to fit a cylinder returned to the factory for repair with those replacement parts which are necessary to return it to 'as good as new' condition. Should the condition of the returned cylinder be such that repair would be uneconomical, you will be notified.

All dimensions are in millimetres unless otherwise stated.

Mounting Styles

The notes which follow provide information for use in specific applications and should be read in conjunction with the information given on page 7.

Extended Tie Rods

The standard tie rod extension for cylinders with mounting style TB, TC and TD is shown as BB in dimension tables. Longer or shorter extensions can be supplied.

Cylinders with extended tie rod mountings TB and TC are supplied with an additional set of mounting nuts of the appropriate grade for securing the cylinder to the machine member. For style TD, tie rods extended both ends, two additional sets of mounting nuts are supplied. In such applications one end is used for mounting and the opposite end to support the cylinder, or to attach other machine components.

Cylinders may be ordered with extended tie rods in addition to another mounting style. The extended tie rods may then be used for mounting other systems or machine components.

Flange Mounted Cylinders

The diameter of the rod gland extension (B), pages 20 and 30, at the head end can be used as a pilot to locate the cylinders in relation to the machine. After alignment has been obtained, the flanges may be drilled for pins or dowels to prevent movement.

Pivot Mountings

Pivot pins are supplied with style BB cap fixed clevis mounted cylinders and style BC cap detachable clevis mounted cylinders, with the exception of 1" bore sizes, which feature a single tang pivot – see page 16.

Trunnion Mounted Cylinders

Trunnions require lubricated pillow blocks with minimum bearing clearances. Blocks should be aligned and mounted to eliminate bending moments on the trunnion pins. Self-aligning mounts must not be used to support the trunnions as bending forces can be set up.

An intermediate fixed trunnion mounting can be positioned to balance the weight of the cylinder, or it can be located at any point between the head or cap to suit the application. The position of the trunnion is fixed during manufacture and its location must be specified at the time of order.

Foot Mounted Cylinders

Foot mounted cylinders should not be pinned or keyed at both ends. Changes in temperature and pressure under normal operating conditions cause the cylinder to increase (or decrease) from its installed length and it therefore must be free to expand and contract. It must not be pinned or keyed at both ends as advantages of cylinder elasticity in absorbing high shock loads would be lost.

Foot Mountings and Thrust Keys

The turning moment which results from the application of force by a foot mounted cylinder must be resisted by secure mounting and effective guidance of the load. A thrust key modification is recommended to provide positive cylinder location.

Thrust key mountings eliminate the need for fitted bolts or external keys on Styles C, F and G side mounted cylinders.

The gland retainer plate is extended below the nominal mounting surface to fit into a keyway milled into the mounting surface of the machine member. See 'Mounting Modifications' in the order code, page 47.

Bore Ø	F Nominal	FA +0.0 -0.075	PA +0.0 -0.2	PD
25.4 (1") ¹	9.5	8	4.9	23.8
38.1 (1½")	9.5	8	4.9	30.2
50.8 (2")	9.5	8	4.9	36.5
63.5 (2½")	9.5	8	4.9	42.9
82.6 (3¼")	15.9	14	8.1	55.6
101.6 (4")	15.9	14	8.1	65.1
127.0 (5")	15.9	14	8.1	77.8
152.4 (6")	19.1	18	9.5	92.1

¹ G mounting is not available with a thrust key on 25.4mm (1") bore cylinders.

Tie Rod Supports

To increase the resistance to buckling of long stroke cylinders, tie rod supports may be fitted. These move the tie rods radially outwards and allow longer than normal strokes to be used without the need for an additional mounting.

Bore Ø	Stroke (Metres)										Number of Supports Required
	1.5	1.8	2.1	2.4	2.7	3.0	3.3	3.6	3.9	4.2	
38.1 (1½")	1	1	1	2	2	2	3	3	3	4	
50.8 (2")	–	1	1	1	1	2	2	2	2	3	
63.5 (2½")	–	–	–	1	1	1	1	1	2	2	
82.6 (3¼")	–	–	–	–	–	1	1	1	1	1	
101.6 (4")	–	–	–	–	–	–	–	1	1	1	

Bore sizes above 101.6mm (4") do not require tie rod supports.

All dimensions are in millimetres unless otherwise stated.

Stroke Tolerances

Stroke length tolerances are required due to the build-up of tolerances of piston, head, cap and cylinder body. Standard production stroke tolerances are -0.4 to +0.8mm on all bore sizes and stroke lengths. For closer tolerances, please specify the required tolerance plus the operating temperature and pressure. Stroke tolerances of less than 0.4mm are generally impracticable due to the elasticity of cylinders and, in these cases, the use of a stroke limiter should be considered – see page 43.

Mounting Bolts

Parker recommends that mounting bolts with a minimum strength of ISO 898/1 grade 10.9 should be used for fixing cylinders to the machine or base. This recommendation is of particular importance where bolts are placed in tension or subjected to shear forces. Mounting bolts should be torque loaded to their manufacturer's recommended figures.

Tie Rod Nuts

Tie rod mounting nuts, with lubricated threads, should be to a minimum strength of ISO 898/2 grade 10, torque loaded to the figures shown.

Bore Ø	Tie Rod Nut Torques	
	Nm min-max	lb.ft min-max
25.4 (1")	3 - 3.5	2 - 2.5

355.6 (14")		

Manifold Ports

Side lug-mounted cylinders (Style C) can be supplied with the cylinder ports arranged for mounting and sealing to a manifold surface. Manifold ports are available with both single- and double-rodged cylinders. The ports are drilled and counterbored for O-ring seals which are provided. With these specifications, the mounting is designated Style CM. Please consult the factory.

Dimensions for rod no. 1 only. For alternative rod sizes, please consult the factory.

Maximum Pressure

The maximum working pressure of 18 bar (250 psi) is based on pure tensile and compressive loadings, without the presence of any bending stresses. Where it is impractical to avoid side loadings, eg: by the use of pivot mountings, please consult the factory giving full details of the application.

In many applications, the pressure developed within a cylinder may be greater than the working pressure, due to pressure intensification across the piston and cushioning, eg: in meter-out circuits. In most cases, this intensification does not affect the cylinder mountings or piston rod threads in the form of increased loading. If the induced pressure with the no. 1 rod exceeds 18 bar (250 psi), please consult the factory.

inPHorm

For more comprehensive information about pressure limitations for individual cylinders, please refer to the European cylinder inPHorm selection program HY07-1260/Eur.

All dimensions are in millimetres unless otherwise stated.

Calculation of Cylinder Diameter

Given that the force and operating pressure of the system are known, and that a piston rod size has been estimated taking account of whether the rod is in tension (pull) or compression (push), then the cylinder bore can be selected.

If the piston rod is in compression, use the 'Push Force' table below, as follows:

1. Identify the operating pressure closest to that required.
2. In the same column, identify the force required to move the load (always rounding up).
3. In the same row, look along to the cylinder bore required.

If the cylinder envelope dimensions are too large for the application, increase the operating pressure, if possible, and repeat the exercise.

If the piston rod is in tension, use the 'Deduction for Pull Force' table. The procedure is the same but, due to the reduced area

caused by the piston rod, the force available on the 'pull' stroke will be smaller. To determine the pull force:

1. Follow the procedure for 'push' applications as described above.
2. Using the 'pull' table, identify the force indicated according to the rod and pressure selected.
3. Deduct this from the original 'push' force. The resultant is the net force available to move the load.

If this force is not large enough, go through the process again but increase the system operating pressure or cylinder diameter if possible. If in doubt, our design engineers will be pleased to assist.

inPHorm

For more comprehensive information on the calculation of cylinder bore size required, please refer to the European cylinder inPHorm selection program HY07-1260/Eur.

Piston Rod Size Selection

The selection of a piston rod for thrust (push) conditions requires the following steps to be carried out:

1. Determine the type of cylinder mounting style and rod end connection to be used. Consult the Stroke Factor table on page 40 and determine which factor corresponds to the application.
2. Using the appropriate stroke factor from page 40, determine the 'basic length' from the equation:
Basic Length = Net Stroke x Stroke Factor
(The graph is prepared for standard rod extensions beyond the face of the gland retainers. For rod extensions greater than standard, add the increases to the net stroke to arrive at the 'basic length'.)
3. Calculate the load imposed for the thrust application by multiplying the full bore area of the cylinder by the system pressure, or by referring to the Push and Pull Force charts on page 38.
4. Using the graph below, look along the values of 'basic length' and 'thrust' as found in 2 and 3 above, and note the point of intersection.

The correct piston rod size is read from the diagonally curved line labelled 'Rod Diameter' above the point of intersection.

Note: When considering the use of long stroke cylinders, the piston rod should be of sufficient diameter to provide the necessary column strength.

Stop Tubes

Stop tubes prevent the cylinder from completing its full stroke, to provide a separation between the piston and the rod bearing at full extension. The required length of stop tube, where necessary, is read from the vertical columns on the right of the

graph by following the horizontal band within which the point of intersection lies. Note that stop tube requirements differ for fixed and pivot mounted cylinders. For cylinders fitted with a stop tube and cushion at the head end, a dual piston arrangement is required – please consult the factory.

If the required length of stop tube is in the region labelled 'consult factory', please submit the following information:

1. Cylinder mounting style.
2. Rod end connection and method of guiding load.
3. Bore required, stroke, length of rod extension (dimension W - dimension V – see pages 20 and 30) if greater than standard.
4. Mounting position of cylinder. (Note if at an angle or vertical, and specify the direction of the piston rod.)
5. Operating pressure of cylinder, if limited to less than the standard pressure for the cylinder selected.

When specifying a cylinder with a stop tube, please insert an S (Special) and the net stroke of the cylinder in the order code and state the length of the stop tube. Note that net stroke is equal to the gross stroke of the cylinder less the length of the stop tube. The gross stroke determines the envelope dimensions of the cylinder. For accurate sizing, please refer to the European cylinder inPHorm selection program HY07-1260/Eur.

Piston Rod Selection Chart

Recommended length of Stop Tube (mm)

Stroke Factors

The stroke factors which follow are used in the calculation of cylinder 'basic length' – see Piston Rod Size Selection, page 39.

Rod End Connection	Mounting Style	Type of Mounting	Stroke Factor
Fixed and rigidly guided	TB, TD, J, JB, C, F, G		0.5
Pivoted and rigidly guided	TB, TD, J, JB, C, F, G		0.7
Fixed and rigidly guided	TC, H, HB		1.0
Pivoted and rigidly guided	D		1.0
Pivoted and rigidly guided	TC, H, HB, DD	 	1.5
Supported but not rigidly guided	TB, TD, J, JB, C, F, G		2.0
Pivoted and rigidly guided	BB, DB, BC		2.0
Supported but not rigidly guided	TC, H, HB		4.0
Supported but not rigidly guided	BB, DB, BC		4.0

Long Stroke Cylinders

When considering the use of long stroke cylinders, the piston rod should be of sufficient diameter to provide the necessary column strength.

For tensile (pull) loads, rod strength is unaffected by stroke length.

For long stroke cylinders under compressive loads, the use of stop tubes should be considered, to reduce bearing stress.

The Piston Rod Selection Chart on page 39 provides guidance where unusually long strokes are required.

inPHorm

For more comprehensive information on the calculation of cylinder bore size required, please refer to the European cylinder inPHorm selection program HY07-1260/Eur.

An Introduction to Cushioning

Cushioning is recommended as a means of controlling the deceleration of masses, or for applications where piston speeds are in excess of 0.1m/s and the piston will make a full stroke. Cushioning extends cylinder life and reduces undesirable noise and pressure peaks.

Deceleration devices or built-in 'cushions' are optional and can be supplied at the head end, cap end, or at both ends of the cylinder without affecting its envelope or mounting dimensions.

Cushion Length & Piston and Rod Mass

Where specified, 2A cylinders incorporate the longest cushion sleeve and spear that can be accommodated within the standard envelope without reducing the rod bearing and piston bearing lengths. See table of cushion lengths below. Cushions are adjustable via recessed needle valves.

inPHorm

Cushioning requirements can be calculated for individual cylinder/load combinations using the European cylinder inPHorm selection program HY07-1260/Eur.

Bore Sizes from 25.4mm to 152.4mm (1" to 6")

¹ Cushions are not available on 25.4mm (1") bore size.

All dimensions are in millimetres unless otherwise stated.

Standard Ports

Series 2A and 2AN cylinders are supplied as standard with R1 size BSPP ports to ISO 228/1, spot faced for sealing washers. Smaller R2 size ports, where demanded by the application, are also available. Parker recommends R1 port sizes for their higher flow rate and piston speed capacity.

Metric threaded ports to DIN 3852 Pt.1, BSPT (taper thread) ports or NPTF ports in sizes as shown for BSPP ports, can be supplied if specified.

Where required, oversize or additional ports can be supplied on the sides of heads and caps that are not occupied by cushion valves. Refer to the tables of port sizes opposite.

Oversize Ports

For higher speed applications, oversize ports can be supplied in all bore sizes. Ports one size larger than standard are the maximum that can be accommodated in most heads or caps within the standard envelope dimensions. Certain oversize metric, BSPT or NPTF ports require welded port bosses. The bosses protrude from the side of the cylinder. Port sizes are shown in the tables opposite.

Note that Y and P dimensions may vary slightly to accommodate oversize ports – please contact the factory where these dimensions are critical.

Manifold Ports

Manifold ports are available on all mounting styles to special order. Side mounted cylinders (Style C) can be supplied with the cylinder ports arranged for mounting and sealing to a manifold surface – see page 37.

Ports and Cushion Adjustment Location

The table below shows standard positions for ports, and cushion adjusting screws where fitted. However, by specifying the position numbers for the desired locations for head and cap ports, many mounting styles can be assembled with ports located at 90° or 180° from standard. In these cases, cushion needle and check valves are also repositioned, where fitted, since their relation with the port position does not change.

Removable Trunnions

Removable trunnions are available when machine structures or confined space prohibit the use of separate pillow blocks situated close to the cylinder sides. Parker offers a removable trunnion design in 38.1mm to 203.2mm (1½" to 8") bore sizes. Mounting diameters and lengths are identical to those in mounting style D and DB for any given bore size. These removable trunnions can be provided on the cap end (see 'Mounting Modifications' in the order code, page 47) of Series 2A cylinders with any rod diameter. They can also be provided on the head end (see 'Mounting Modifications' in the order code, page 47) of cylinders with standard rods (rod no. 1).

Maximum pressure ratings of the removable trunnion mountings are shown in the table below.

Bore Ø	Bar	psi
38.1 to 101.6 (1½" to 4")	18	250
127.0 (5")	10	150
152.4 (6")	13	200
203.2 (8")	8.5	125

Single-Acting Cylinders

Standard 2A series cylinders are of the double-acting type. They are also suitable for use as single-acting cylinders, where the load or other external force is used to return the piston after the pressure stroke.

Spring-Returned, Single-Acting Cylinders

Series 2A single-acting cylinders can also be supplied with an internal spring to return the piston after the pressure stroke. Please supply details of load conditions and friction factors, and advise whether the spring is required to advance or return the piston rod.

On spring-returned cylinders, it is recommended that tie rod extensions be specified on the cylinder end in which the spring is located to allow the spring to be 'backed off' until compression is relieved. Tie rod nuts should be welded to the tie rods at the opposite end of the cylinder, to further assure safe disassembly. Please consult the factory when ordering spring-returned cylinders.

Stroke Limiter

Where absolute precision in stroke length is required, a screwed adjustable stop can be supplied. Several types are available – the illustration shows a design suitable for infrequent adjustment at the uncushioned cap end of a cylinder. Please contact the factory, specifying details of the application and the adjustment required.

Bore Ø	J	K min	L max
38.1 (1½")	11	85	127.0
50.8 (2")	17	85	127.0
63.5 (2½")	17	85	203.2
82.6 (3¼")	17	85	203.2
101.6 (4")	17	85	203.2
127.0 (5")	17	85	228.6
152.4 (6")	22	85	228.6
203.2 (8")	22	85	457.2

Multiple Stroke Positioning

To obtain linear force in one plane with controlled stopping at intermediate points, several designs are available. For three stopped positions, it is common practice to mount two standard single rod Style H cylinders back-to-back, or to use through-tie rods. By extending or retracting the stroke of each cylinder independently, it is possible to achieve three positions at the piston ends. An alternative technique is to use a tandem cylinder with an independent piston rod in the cap section. Please consult the factory for further details.

Rod End Bellows

Unprotected piston rod surfaces which are exposed to contaminants with air hardening properties should be protected by rod end bellows. Longer rod extensions are required to accommodate the collapsed length of the bellows. Please consult the factory for further information.

Metallic Rod Wipers

Metallic rod wipers replace the standard wiper seal, and are recommended where dust, ice or splashing might damage the wiper seal material. Metallic rod wipers do not affect cylinder dimensions.

DC Proximity Sensors

These can be fitted to give reliable end of stroke signals. Please consult the factory for further information.

All dimensions are in millimetres unless otherwise stated.

Service Assemblies and Seal Kits

Service Assembly Kits and Seal Kits for 2A cylinders simplify the ordering and maintenance processes. They contain sub-assemblies which are ready for installation, and are supplied with full instructions. When ordering Service Assemblies and Seal Kits, please refer to the identification plate on the cylinder body, and supply the following information:

Serial Number - Bore - Stroke - Model Number - Fluid Type

Key to Part Numbers

- 1 Head
- 7 Cap
- 14 Gland/bearing cartridge
- 15 Cylinder body
- 17 Piston (Lipseal)
- 18 Cushion sleeve
- 19 Tie rod
- 23 Tie rod nut
- 27 Retainer
- 34 Piston rod – single rod, no cushion
- 35 Piston rod – single rod, cushion at head end
- 36 Piston rod – single rod, cushion at cap end
- 37 Piston rod – single rod, cushion at both ends
- 40 Wiperseal – for gland
- 41 Lipseal – for gland
- 42 Lipseal – for piston

- 70 Needle valve, cushion adjustment (bore sizes above 63.5mm)
- 70a Needle valve assembly, cartridge type (bore sizes up to 63.5mm)
- 71 Ball – cushion check valve
- 72 Cushion check valve screw
- 73 Floating cushion bush
- 74 Retaining ring for cushion bush

* Seal Groups – Ordering

The part numbers shown in the tables above are for Group 1 seals. For Group 5 seals, substitute a '5' for the '1' at the end of the number sequence. For example, a Group 5 RG gland cartridge kit for a 50.8mm bore cylinder will be RG2AHL205.

Service Kits

Group 1 Service Kits contain seals of Nitrile (Buna-N) elastomers.

Group 5 Service Kits contain seals of fluorocarbon elastomers.

For further information on seals please refer to page 5.

Tie Rod Torques

Please refer to the table on page 37.

Contents and Part Numbers of Service Assembly Kits

(see key to part numbers opposite)

Head Assembly

Non-cushioned: 1, 47

Cushioned: 1, 47, 69, (69a), 70, (70a), 71, 72

Cap Assembly

Non-cushioned: 7, 47

Cushioned: 7, 47, 69, (69a), 70, (70a), 73, 74

Cylinder Body

All types: 15

Cushion Screw/Cartridge Assembly

Screw type: 69, 70

Cartridge type: 69a, 70a

Check Valve Screw Assembly

Screw type: 69, 71, 72

Piston Rod Assemblies

These kits contain a fully assembled piston and rod assembly which is ready to install. They comprise a piston assembly, plus a rod assembly from the types listed below.

Piston Assemblies

Lipseal: 17, 42, 44

Rod Assemblies

Single rod, non-cushioned: 34

Single rod, cushioned head: 35, 18

Single rod, cushioned cap: 36

Single rod, cushioned both ends: 37, 18

Double rod, non-cushioned: 57, 60,

Double rod, cushioned stronger end: 58, 60, 18

Double rod, cushioned weaker end: 58, 61, 18

Double rod, cushioned both ends: 58, 61, 18 x 2

Repairs

Although 2A cylinders are designed to make on-site maintenance or repairs as easy as possible, some operations can only be carried out in our factory. It is standard policy to fit a cylinder returned to the factory for repair with those replacement parts which are necessary to return it to 'as good as new' condition. Should the condition of the returned cylinder be such that repair would be uneconomical, you will be notified.

Non-Lubricated Service Kits

Service kits for 2AN Series non-lubricated air cylinders are shown on page 35.

Parker "Lube-A-Cyl" Air Cylinder Lubricant

"Lube-A-Cyl" is intended as a supplement to normal lubrication methods, and is recommended for use during reassembly of air cylinders after servicing. It also helps to prevent damage to static and dynamic seals. This multi-purpose lubricant is available in 110g (4 oz) tubes, part no. 76163.

Storage

When cylinders must be stored for a period of time, the following procedures are recommended:

1. Store the cylinders in an indoor area which has a dry, clean and non-corrosive atmosphere. Take care to protect the cylinder from both internal corrosion and external damage.
2. Whenever possible, cylinders should be stored in a vertical position (piston rod up). This will minimize corrosion due to possible condensation which could occur inside the cylinder, and seal set due to the weight of the piston and rod assembly.
3. Port protector plugs should be left in the cylinder until the time of installation.
4. For long duration storage add a vapour phase inhibitor to both sides of the piston to prevent internal corrosion.

Installation

1. Cleanliness is an important consideration, and Parker cylinders are shipped with the ports plugged to protect them from contaminants entering the ports. These plugs should not be removed until the piping is to be installed. Before making the connection to the cylinder ports, piping should be thoroughly cleaned to remove all chips or burrs which might have resulted from threading or flaring operations.
2. Cylinders operating in an environment where air drying materials are present such as fast-drying chemicals, paint, or weld splatter, or other hazardous conditions such as excessive heat, should have shields installed to prevent damage to the piston rod and piston rod seals.
3. Correct alignment of the cylinder piston rod and its mating component on the machine should be checked in both the extended and retracted positions. Incorrect alignment will result in excessive rod gland and/or cylinder bore wear, shortening the life of the cylinder.

Warranty

Defective Work or Material Every effort is made to ensure sound material and good workmanship, but the Seller gives no warranty, expressed or implied, of material, workmanship, or fitness of goods for any particular purpose, whether such purpose be known to the Seller or not. In the event of any material or workmanship proving defective the Seller is prepared to rectify or replace such material at the place of delivery and in the condition originally specified, or if rectification or replacement is not practicable, will credit the value of the goods at the invoice price, if required in writing to do so, provided always that the claim is made and admitted and the material is returned within six months from date of invoice. The Seller's liability in respect of or consequent upon any such defect whether in original or replaced material or workmanship, is limited as aforesaid and does not extend in any circumstances to cover any other expenditure incurred nor any consequential damages or loss of profit.

Masses – Series 2A Cylinders

To determine the mass of the cylinder, first select the basic mass for zero stroke from the table, then calculate the mass for the cylinder stroke and add the result to the basic mass.

Masses for accessories are shown on pages 31 to 33.

Bore Ø	Rod No.	Single Rod Cylinders			Double Rod Cylinders		
		Mass at Zero Stroke		Mass per 10mm Stroke (kg)	Mass at Zero Stroke		Mass per 10mm Stroke (kg)
