## A new dimension in performance

If you are involved with high performance servomotor applications, there is an important motor technology which you should know about. It's the technology found in ServoDisc motors from Kollmorgen.

What separates the ServoDisc motor from conventional DC servos is its ironless disc armature. As we shall see, this difference enables ServoDisc motors to deliver a level of performance, in both incremental motion and continuous speed applications, which is not attainable with conventional ironcore motor designs.

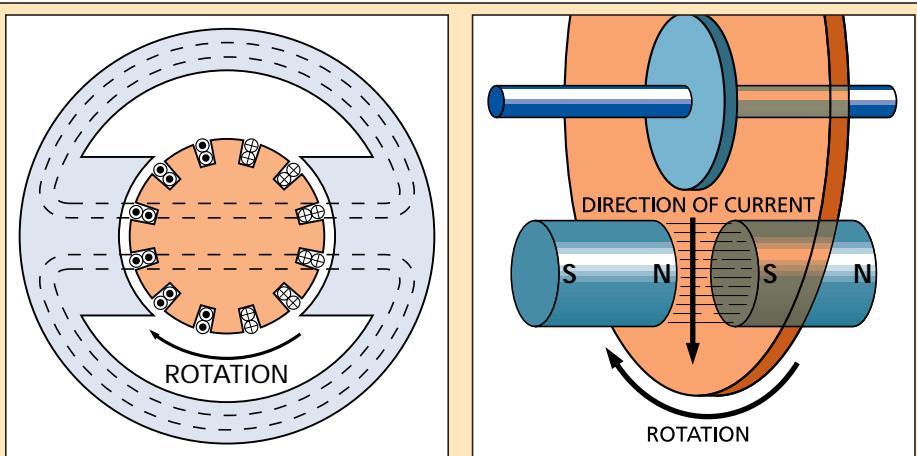

In addition to performance advantages, ServoDisc motors have a unique compact shape that can be an attractive alternative when solving tight packaging problems.

### Unique ironless design

In a conventional slot-wound servomotor, the armature is constructed from a heavy, laminated ironcore wound with coils of wire. In a ServoDisc motor, the armature has no iron. Instead, it is constructed from several layers of copper conductors in a unique flat-disc configuration.

Not only are the armature designs completely different, so is the shape and internal construction. In a conventional servo, the permanent magnets are mounted on the motor shell creating a radial magnetic field, perpendicular to the shaft (Fig. 1). Because the magnet pairs are so far apart, the iron core of the armature is needed to contain and focus the lines of magnetic flux. Motors of this type are typically long, thin and heavy.

In a ServoDisc motor, the magnets are mounted on the end plates creating an axial magnetic field, parallel to the shaft.

### Ironcore Motor

A conventional ironcore motor uses a radial design with magnets placed concentrically around the shaft in such a way as to produce a radial magnetic field. (Fig. 1) The armature consists of slotted steel laminations wound with coils of wire which interact with the magnetic field to produce torque. As the motor rotates a commutator automatically maintains the correct current flow. A ServoDisc motor uses entirely different physical construction. The motor is designed with the magnetic field aligned axially, parallel to the shaft. (Fig. 2) The conductors in the arma-

### ServoDisc Motor

ture have a current flow which is perpendicular to the magnetic field (radial to the shaft). This produces a torque perpendicular to both the magnetic field and the current (the left-hand rule). This force rotates the shaft. This construction approach is much more efficient than the radial design of conventional ironcore motors and eliminates the heavy iron armature and the electrical losses associated with it. The large number of commutations possible with Kollmorgen's unique flat armature produce dramatically smoother torque output.

This leads to a very small air gap between the magnets, separated only by the thickness of the disc armature - a very clean and effective design approach. Torque is created when the current flowing radially through the copper conductors interacts directly with the field of the permanent magnets (Fig. 2). This configuration is a very efficient way of producing torque. These different approaches produce dramatically different motors (Fig. 3).

### Outdistances other DC servos

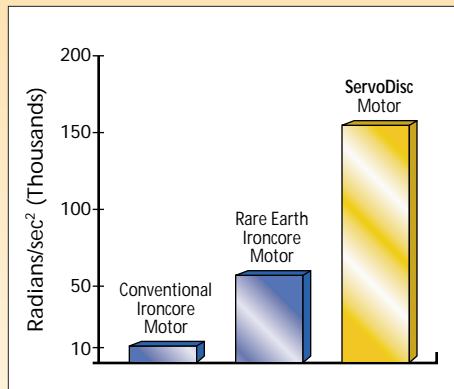

The iron-free ServoDisc armature provides some significant performance advantages for motion control applications.

## COMPARISON OF PERFORMANCE FEATURES

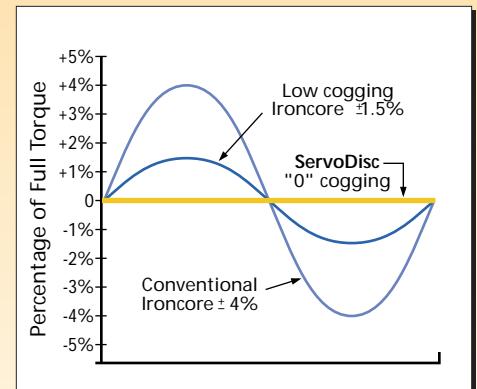

### Size

The ServoDisc armature is much smaller and lighter than bulky ironcore designs of equivalent output.

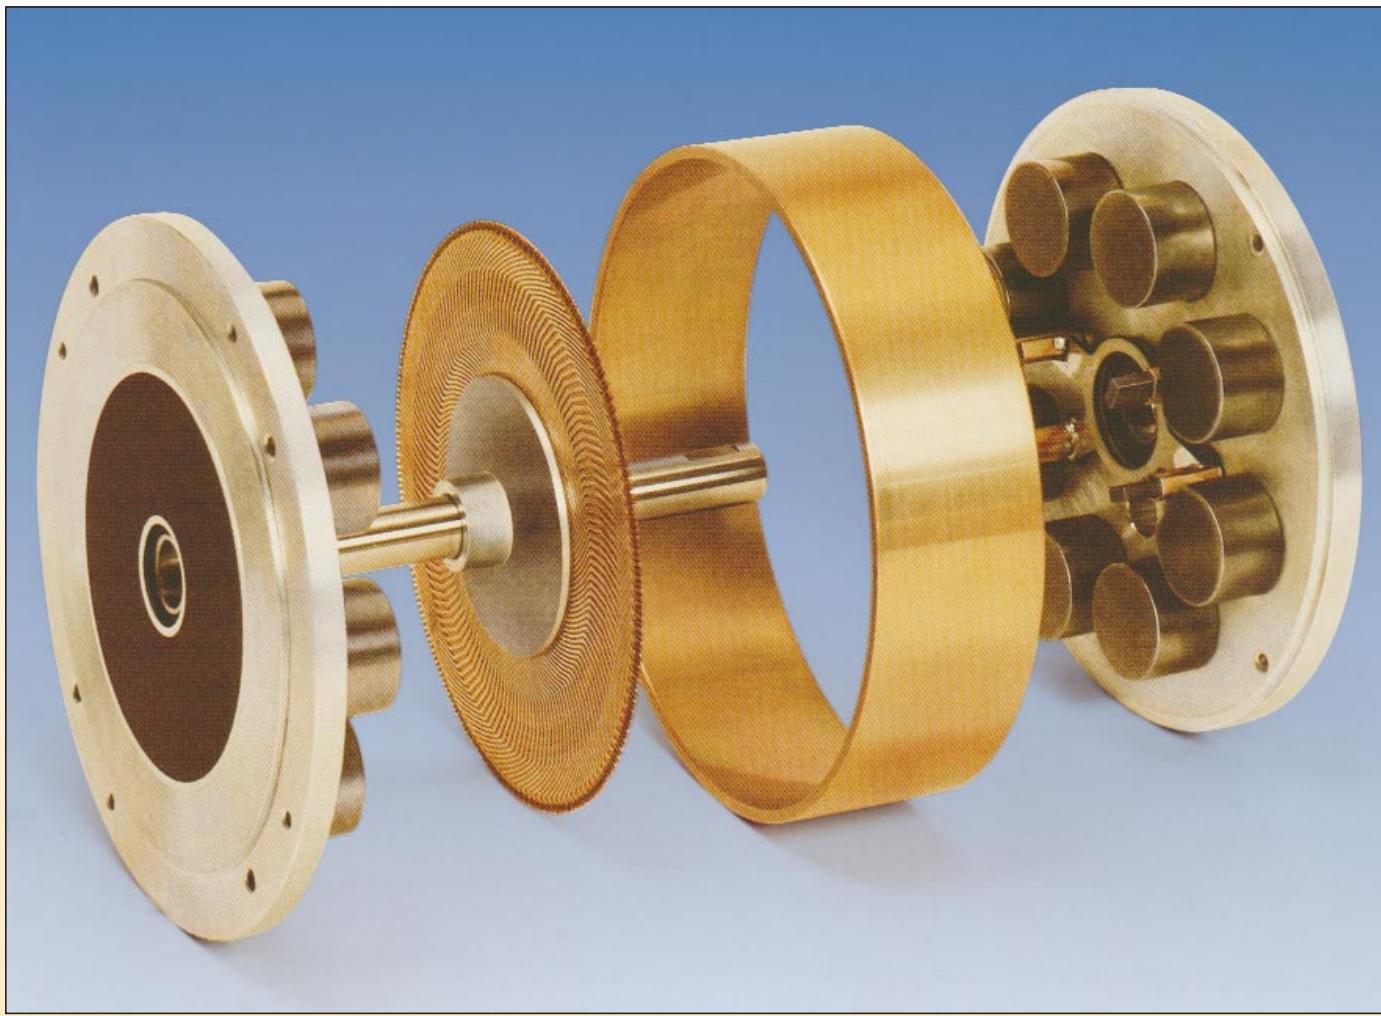

### Acceleration

ServoDisc motors accelerate up to 10 times faster than conventional servo motors.

### Cogging

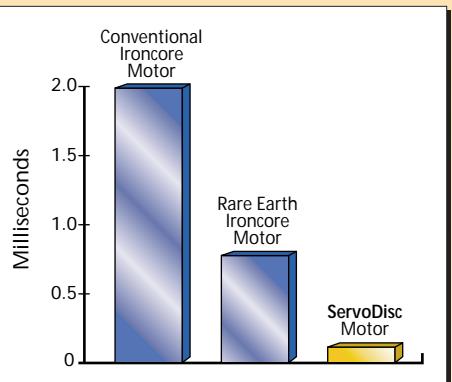

The ironless ServoDisc armature has absolutely no cogging at any speed of operation.

## Faster acceleration

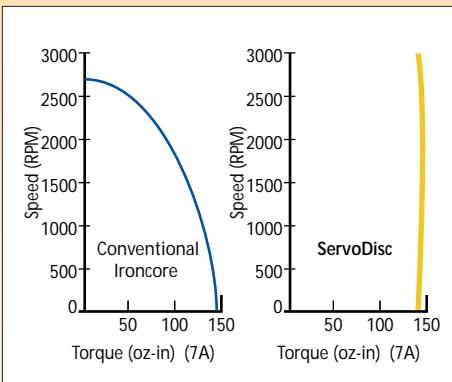

The thin, low-inertia armature design leads to exceptional torque-to-inertia ratios. This translates into blazing acceleration (Fig. 4). A typical ServoDisc motor can accelerate from 0 to 3000 rpm in only 60 degrees of rotation. In some applications,

the entire move can be performed in less than 10 milliseconds. This means shorter cycle times, more moves per second and higher throughput. For incremental motion applications, this translates into higher productivity and more profitability.

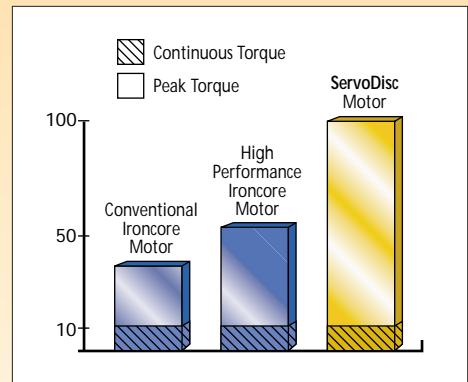

### Electrical Time Constant

A very low electrical time constant results in torque much sooner than with conventional wire-wound motors.

### Torque-Speed Curves

With full torque from 0 to full speed, ServoDisc motors solidly outperform conventional motors.

### Peak Torque Capability

High peak torque capability means more throughput than is available from standard servos.

## Perfectly smooth rotation

If you rotate a conventional motor when it is unpowered, you will notice that it pulls into certain preferred positions. This occurs when the iron laminations in the armature line up with the permanent magnets on the stator. This phenomenon is called "cogging." It also occurs when the motor is powered and shows up as torque disturbances which can be a serious problem in critical applications. The ServoDisc armature, being ironless, is not attracted by the magnets and, consequently, has intrinsically zero cogging (Fig. 5). The result is ultra-smooth rotation at any speed.

## Long brush life

Because there is no iron, there is nearly no inductance. The result is no arcing, because there is no stored energy in the armature to be dissipated during commutation. In an ironcore motor, a lot of energy is stored in the magnetic field of each coil. When this field collapses, the energy may be discharged by arcing to the brushes. Arcing, not friction, is the major cause of brush wear. The elimination of arcing leads to very long brush life in most applications. In fact, depending on the application, it is possible for the brushes to last as long as the bearings.

## High speed capability

No arcing also means no commutation limits due to speed. In a conventional motor, arcing increases as speed increases and eventually causes motor operation to become erratic. ServoDisc motors do not suffer from this problem and can run to 4000 rpm and above.

## Instantaneous torque

Low inductance provides another advantage...low electrical time constant. This is a measure of how long it takes for current to flow into the armature. For ServoDisc motors, this is much less than one millisecond (Fig. 6). This means full torque almost instantly; a key to fast moves and accurate tracking.

## Full torque from 0 to 4000 rpm

In a conventional motor there are losses associated with rotating the iron armature in a magnetic field. These losses increase with speed, so as the motor goes faster, it uses more and more of its available torque just to keep itself turning. Consequently, less torque is left to deliver to the output shaft (Fig. 7A). ServoDisc motors do not have these iron-associated losses and, as a result, deliver more torque over their entire speed range. In fact, the torque is almost constant from 0 to 4000 rpm (Fig. 7B). Compare this performance with the torque-speed characteristics of a conventional motor.

When sizing a conventional motor, the torque drop-off with speed may require you to select the next higher size to get sufficient torque at high speed. You will never have this problem with a ServoDisc motor.

## Extra torque on call

For rapid acceleration and deceleration, higher than normal torque is usually required. To produce this temporary peak torque, a peak current is applied to the motor. In an iron-core design, the magnetic field of the armature can interact with and demagnetize the permanent magnets. Because of this effect, peak current is generally limited to 2 or 3 times the continuous current rating. With the non-magnetic ServoDisc armature and axial magnetic field, this problem is virtually eliminated. Most ServoDisc motors are rated for peak current of 10 times the continuous rating (Fig. 8).

## Sizes for every application

ServoDisc motors use a very "well behaved" technology. As a result, products have been developed which cover a wide range of package sizes and power levels. Motors are presently available with torques from 10 oz-in to 20 lb-ft and power outputs from 30 watts to 4.5 kilowatts. This means a product match for nearly every application .

## Easy to design in

The disc armature design leads to a unique flat motor package. This is generally easier to design in than much longer conventional motors. From a performance standpoint, this shape provides closer physical coupling and better torsional stiffness. These key factors can optimize your mechanical design.

## INTRODUCTION

- Options:
  - Integral tachometers
  - External tachometers
  - Optical encoders
  - Fail-safe brakes
  - Aluminum armature
  - Hardened commutator
  - Forced air cooling
  - Dust cover with CPC or splash-tite connectors
  - Industrial cover with MS connectors
  - IP65 water resistant
  - Cable and connector options

### Compatible Products

- KXA Plus Amplifier
- PWM Amplifiers

- **50 to 186 oz-in (35 to 130 N-cm) Continuous Torque**
- **Motor Lengths Less Than 2 Inches**
- **4.37 to 5.5 Inches OD Round Frame**
- **Optional Tachometer and Encoder Feedback**

PLATINUM™ Series is a new generation of ServoDisc motors. Offering numerous new design improvements that have been proven to increase life, reliability and performance, the PLATINUM Series is a direct replacement for the existing U-Series and S-Series motors.

- Form fit, function replacement for the 9cm and 12cm U-Series
- “Torque Frame” concept provides up to 2x the torque range within identical motor frames
- 15% to 40% weight reduction versus the U-Series
- Flexible manufacturing design reduces customer lead times without limiting customer options
- All-aluminum construction increases resistance to corrosive environments
- Ironless, low inertia armature for rapid acceleration
- Zero cogging for smooth operation at low speeds
- Easy field replaceable brush assembly

## INTRODUCTION

- Options:
  - Integral tachometers
  - External tachometers
  - Optical encoders
  - Fail-safe brakes

### Compatible Products

- KXA Plus Amplifier
- EM19 Linear Amplifier

- **39 to 402 oz-in (27-284)N-cm continuous torque**
- **Motor Lengths Less Than 2"**
- **4.37 to 7.37" OD Round Frame**
- **Optional Tachometer and Encoder Feedback**

U-Series ServoDisc motors employ the unique Kollmorgen flat disc armature. The ironless, low inertia armature delivers high acceleration and zero cogging in an exceptionally compact package.

- Extremely good speed control with zero cogging and low RFI
- Long brush life
- Flat ServoDisc motors are ideal for many applications:
  - Save space and weight in applications requiring a low profile motor
  - Large torsional stiffness for precision control of speed and acceleration

Notes:

- 1) All values are based upon a 150°C armature temperature limit and with the motor mounted on an 8" x 16" x 3/8" aluminum heatsink with no forced air cooling. Other voltages, speeds, and torques, and duty cycles are achievable as long as the max armature temperature of 150°C is not exceeded.
- 2) Mass air flow (lbs/min) = air volume (CFM) x air density (lbs/ft<sup>3</sup>).
- 3) Terminal resistance is measured at 4.0 amps. RT varies as a function of applied current.
- 4) Unless otherwise noted, all specifications above apply at 25°C.
- 5) Peak torque and current is calculated based on max pulse duration of 50 milliseconds and a 1% duty cycle.
- 6) The operating current can be calculated as: I = (Shaft torque + TF + KD x N/1000) / KT.
- 7) The operating voltage can be calculated as: V = KE x (N/1000) + RT x I.
- 8) Tachometer ripple measured with a resistive load of 1 kohm and a single low pass filter with 3db cut off at 500 Hz.
- 9) Tachometer minimum load resistance of 500 ohms.

## PLATINUM REFERENCE GUIDE

Kollmorgen also offers the PLATINUM™ Series motors, a new generation of ServoDisc motors. These motors offer increased life, reliability and performance, and may be used as a direct replacement for the U-Series motors. This reference guide shows suggested equivalent PLATINUM and U-Series, S-Series, and N-Series motors currently offered by Kollmorgen.

# S-Series ServoDisc

## INTRODUCTION

- **21 to 85 oz-in (15-60 N-cm) Continuous Torque**
- **3.39 to 4.37" OD Round Frame**
- **Motor Lengths Less Than 2"**
- **Optional Rugged Housing**
- **Optional Tachometer or Encoder Feedback and Fail-safe Brakes**

S-Series ServoDisc motors employ the unique Kollmorgen flat disc armature. The ironless, low inertia armature delivers high acceleration and zero cogging in an exceptionally compact package.

Rugged housings and mil-type connectors added to S-Series motors protect the motors and optional integral components such as encoders, tachometers and fail-safe brakes. They have been designed for harsh industrial environments where protection from damaging elements is essential.

- Extremely good speed control with zero cogging and low RFI
- Long brush life
- Flat ServoDisc motors are ideal for many applications:
  - Save space and weight in applications requiring a low profile motor
  - Large torsional stiffness for precision control of speed and acceleration

- Options:
  - Tachometers
  - Optical encoders
  - Fail-Safe brakes
  - Rugged housing and mil-type connectors

### Compatible Product

Notes:

- All values are based upon a 150°C armature temperature limit and with the motor mounted on an 8" x 16" x 3/8" aluminum heatsink with no forced air cooling. Other voltages, speeds, and torques, and duty cycles are achievable as long as the max armature temperature of 150°C is not exceeded.
- Mass air flow (lbs/min) = air volume (CFM) x air density (lbs/f<sup>3</sup>).
- Terminal resistance is measured at 4.0 amps. RT varies as a function of applied current.
- Unless otherwise noted, all specifications above apply at 25°C.
- Peak torque and current is calculated based on max pulse duration of 50 milliseconds and a 1% duty cycle.
- The operating current can be calculated as: I = (Shaft torque + TF + KD x N/1000) / KT.
- The operating voltage can be calculated as: V = KE x (N/1000) + RT x I.
- Tachometer ripple measured with a resistive load of 1 kohm and a single low pass filter with 3db cut off at 500 Hz.
- Tachometer minimum measured with a resistance of 370 ohms.
- Bidirectional tolerance of tachometer will not exceed 3%.

Contact a Kollmorgen Sales Office for more details.
- Measured at 4.0 Amps. It varies slightly with current due to variations in brush contact drop.
- Maximum Permissible Dissipation = (150 - Amb. Temp. °C)/RAA.  

$$\text{Total Motor Losses} = RT \times I^2 + 0.74 (TF + TD) \times N/1000 \text{ where } TD = KD \times N/1000$$
- Peak Acceleration with Load = (TP - Reflected Load Frict.)/(JM + Reflected Load Inertia).

### FERRITE MOTOR WITH INTEGRAL TACHOMETER

# Ferrite Kit Series ServoDisc

## INTRODUCTION

The designer of precision equipment has a low cost yet a technically smart solution to drive it. Coupling costs and alignment problems are eliminated. The total package is compact.

The applications of these motors are wide in range. One of the key advantages is the compact design, where in many cases, it is important where space is limited.

An encoder-mount is available for these motors to accept a kit encoder in order to close a digital control loop. Some typical applications are listed below:

- Use your own high-performance precision spindle
- A cost-effective solution to drive high-precision machines
- Zero cogging design, smooth rotation at low speeds
- Constant torque over a wide speed range

- **17 to 103 oz-in (12-73 N-cm) Continuous Torque**
- **4.72 to 8.47" OD Round Frame**
- **Direct Drive, No Coupling**
- **Space-Saving Design**

### Putting Together Your Own High-Performance DC Motor

Designers who want to save both time and cost can obtain all these advantages by assembling the kit motor. The inherent simplicity of design leads to a highly simple mechanical structure that the user can put together himself or build into his own drive system.

The motor consists of two components: the flat ServoDisc armature and the end bell with magnet and brushes. The armature is available in several types depending on the application. For example, armatures for low voltages or low inertia can be used when required.

The magnet in the stamped end bell is a ring of ceramic ferrite material which has been precharged to produce eight alternately polarized magnetic poles. Unlike Alnico permanent magnetic material, the ferrite is a type of permanent magnet that retains its magnetism even without a keeper or flux-return path.

Because of the use of the integral drive shaft rather than a separate motor shaft and bearings, there is no mechanical coupling and a minimum of torsional resonance. There is less bearing friction with increased efficiency and no problems due to shaft misalignment. In effect, the motor is assembled onto the drive system.

### Integration

N-Series ServoDisc motors employ the unique Kollmorgen flat disc armature and high-energy neodymium-iron-boron magnets resulting in an ultra-thin motor. The ironless, low inertia armature delivers high acceleration and zero cogging.

- Neodymium magnet technology
- Fast Acceleration for higher throughput
- Extremely good speed control, zero cogging and low RFI
- Long brush life
- Flat ServoDisc motors are ideal for many applications:
  - Save space and weight in applications requiring a low profile motor
  - Large torsional stiffness for precision control of speed and acceleration
- Options:
  - With or without integral tachometer
  - Optical encoder
  - Brake

Notes:

- All values are based upon a 150°C armature temperature limit and with the motor mounted on an aluminum heatsink with no forced air cooling. Other voltages, speeds, and torques, and duty cycles are achievable as long as the max armature temperature of 150°C is not exceeded.
- Mass air flow (lbs/min) = air volume (CFM) x air density (lbs/ft<sup>3</sup>).
- Terminal resistance is measured at 4.0 amps. RT varies as a function of applied current.
- Unless otherwise noted, all specifications above apply at 25°C.
- Peak torque and current is calculated based on max pulse duration of 50 milliseconds and a 1% duty cycle.
- The operating current can be calculated as: I = (Shaft + TF + KD x N/1000) / KT.
- The operating voltage can be calculated as: V = KE x (N/1000) + RT x I.

Notes:

- A. All curves are drawn for a fixed armature temperature of 150°C.
- B. The motor can be operated at any point on the graph below 4000 RPM. Higher speeds can be obtained for short periods of time. Contact a Kollmorgen Sales Office for more details.
- C. Determine voltage required for a desired combination of speed and torque by locating it on the appropriate 'constant terminal voltage curve.'

- D. Determine the required cooling by locating the desired operating point on the appropriate 'Constant cooling curve.'
- E. The operating current can be calculated as:  

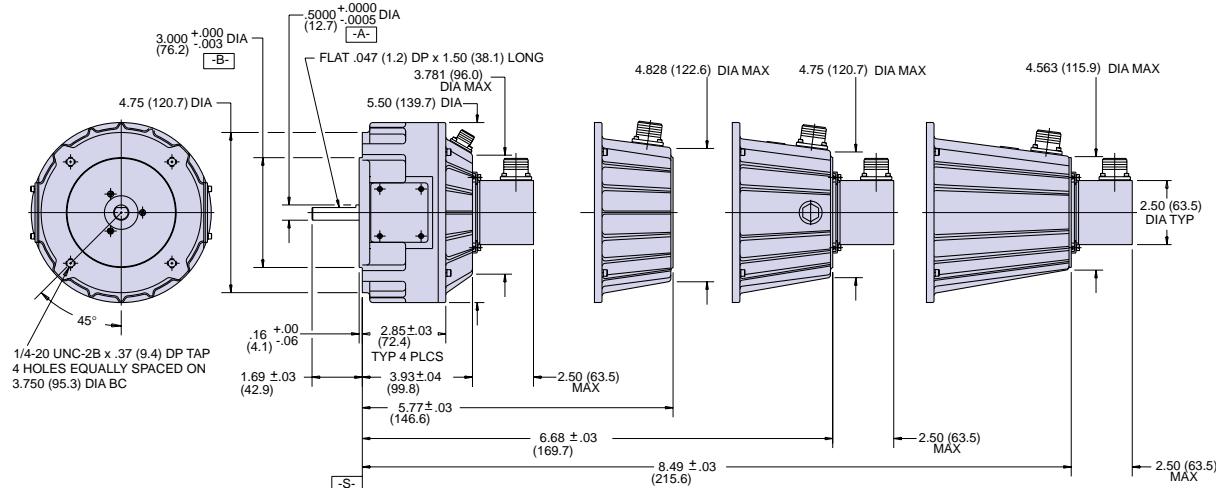

$$I = (\text{Shaft torque} + \text{TF} + \text{KD} \times N/1000) / \text{KT}$$
- F. The operating voltage can be calculated as:  

$$V = KE \times N/1000 + RT \times I$$

## INTRODUCTION

- **8 to 2604 in-lb (.9 to 294 N-M) Continuous Stall Torque**
- **Virtually Zero to Medium Backlash Models**
- **Compact, Inline Packaging**
- **Powered by High-Performance DC ServoDisc Motors**

Kollmorgen provides an assortment of gearmotors. Characteristics of all these products include high-torque-to-weight ratios, smooth constant torque and fast acceleration.

- The Accurex™ series, with virtually zero backlash, is designed with a minimum of moving parts for extremely reliable operation
- The Revex™ series uses proven spur gear technology to produce a wide range of exact gear ratios with a maximum of 5 arc minutes of backlash
- The Indurex™ series provides fully reversible helical gearing which results in an exceptional gearmotor actuator
- The low voltage Ferrite series is the flattest design, ideal for battery-powered applications

### ACCUREX

- Virtually zero backlash for high-position accuracy
- Continuous output torque up to 500 in-lb
- Heavy duty bearing design
- Harmonic drive components for simplicity, high reliability and compact shape
- Exact reduction ratios: 60, 80, 100, 120 and 160:1
- High torque capacity in single-stage ratio
- IP55 environmental sealing and prep for resolver are available

### REVEX

- Extremely low backlash; less than 5 arc-minutes
- High-torsional stiffness to ensure high accuracy and repeatability in positioning applications

- Exact reduction ratios: 10:1 up to 100:1 (other ratios optional)
- Continuous output torque up to 2604 in-lbs
- Compact and lightweight
- Gearhead can be sold separately  
(consult an Kollmorgen Sales Office)
- IP55 environmental sealing and prep for resolver are available

### INDUREX

- Low backlash; less than 20 arc-minutes
- Compact ultraquiet design
- Industrial compact design
- Reduction ratios 3.67:1 up to 98.87:1
- Continuous output torque up to 2580 in-lbs
- IP55 environmental sealing and prep for resolver are available

### FERRITE

- Flat shape and lightweight for easy design intergration
  - Reduction ratios from 15:1 to 150:1
  - Continuous output torque up to 200 in-lbs
  - Suitable for battery operation: 12 or 24 Volts
  - Constant torque over the entire speed range
  - Zero cogging for smooth operation
  - Low inertia produces rapid, accurate response to command signals
- Options:
- Tachometers or encoders
  - Fail-safe brakes

### Compatible Products

- KXA Plus Amplifier
- EM19 Linear Amplifier

# Disk armature technology brings new dimensions of performance to dc servo motor applications

## Where it works best

Certain types of applications are naturals for ServoDisc technology. Let's look at the categories where the benefits are the greatest.

### a) Fast moves

Incremental motion (rapid, repetitive moves) is a natural for the outstanding acceleration of these products. If you need to make many moves a second, this is the right technology. If you must get to speed quickly or stop quickly, ServoDisc will do it best.

### b) Smooth Rotation

ServoDisc products are perfect when precise and smooth speed control is required. Applications such as tape or film handling or recording, machining, rotating mirrors or scanners. The total lack of cogging and the rapid response of these motors gives near perfect rotation.

### c) Operation over a wide speed range

If you need 1 rpm, then 1000, then 4000, no other product can deliver the precise rotation, constant torque and trouble-free commutation which are characteristic of ServoDisc products. Low speed is not limited by cogging and high speed is not limited by arcing and commutation problems.

### d) Compact Size

When space is at a premium, the unique ServoDisc package may be the answer. Its flat profile and high power output make it easier to design in than conventional motors. This may be just the edge you need to put your design ahead of the competition.

## A Track Record of Success

The unique technology and superior performance of the ServoDisc motor make it the best choice for a tremendous range of servo applications. Increased throughout, better accuracy, improved packaging, longer life; these are just a few of the benefits that can be realized with this exciting technology.

### a) Automation and robotics

Speed and acceleration capabilities separate ServoDisc motors from the conventional motor pack. Apply these products to packaging, sorting, labeling, component insertion, precision winding...any application where throughput is critical. Compact size and high torque make these motors ideal for robot axis drives. Compact ServoDisc precision gearmotors combine exceptional performance with innovative packaging. The same features make them great for robotic positioning tables.

### b) Instrumentation

Superior technology is called for when performance and accuracy are critical. Inspection equipment, x-y stages,

chromatography equipment, ultrasonic and optical scanners, plotters, shutter actuation...all of these applications can benefit from the rapid response and precise motion which is characteristic of ServoDisc products.

### c) Process control

Extraordinary responsiveness and cog-free rotation have earned ServoDisc products an important niche in process control applications. They can deliver fast, accurate metering of chemicals or fluids. The unparalleled smoothness is perfect for handling continuous materials such as tape, film, paper, textiles or optical fibers. In fact any application involving continuous webs is a natural for this technology. Which accounts for its extensive use in the film, paper, printing and textile industries. Textile applications also include fabric cutting and stitching equipment.

### d) Information handling

No cogging and the ability to maintain precise speed and phase lock are perfect features for audio, video, analog and digital recording. ServoDisc motors have an impressive track record in tape mastering and duplication equipment, instrumentation recorders and studio-grade recording equipment. They have also made their mark in the growing video disk industry.

### e) Biomedical equipment

Portability, reliability and superior performance have made a name for ServoDisc motors in many medical life-support analysis applications. Blood pumps, blood analyzers, kidney dialysis, respirators and ultrasonic scanners are all candidates for this advanced technology.

### f) Semiconductor manufacturing

ServoDisc motors are an excellent match for the demanding performance requirements of the semiconductor manufacturing industry. For die and wire bonding, wafer handling, cleaning, testing and dicing, and laser trimming, the high throughput, perfectly smooth rotation and precision of these motors can really crank up productivity.

### g) Business automation

Demand is increasing in the business community for increased performance and productivity from office automation equipment. The application of ServoDisc technology to check sorters, imprinters, document readers, high speed printers and collating equipment has answered the call.

### h) Military applications

Rugged design, reliability, long life, compact packaging and outstanding performance have put ServoDisc products in the front lines. Gun turrets, gun loaders, fire control drives, smoke generators and antenna rotation drives are just some of the applications where we serve.
